Cambridge:

PRINTED BY C. J. CLAY, M.A. AND SONS,
AT THE UNIVERSITY PRESS.
THE present appears to be the first English edition of the
Timaeus. Indeed since the sixteenth century, during which
this dialogue was published separately no less than four times,
it had not, so far as I am aware, been issued apart from the
rest of Plato's works until the appearance of Lindau's edition,
accompanied by a Latin translation, in 1828. Lindau's com-
mentary, though here and there suggestive, does not afford
much real help in grappling with the main difficulties of the
dialogue; and sometimes displays a fundamental misappre-
hension of its significance. Ten years later came Stallbaum's
dition; concerning which it were unbecoming to speak with
less than the respect due to the zeal and industry of a scholar
who has essayed the gigantic enterprise of editing with elaborate
prolegomena and commentary the entire works of Plato, and it
would be unfair to disparage the learning which the notes
display: none the less it cannot be denied that in dealing
with this dialogue the editor seems hardly to have realised
the nature of the task he has undertaken. Stallbaum was
followed in 1841 by Th. H. Martin, whose work, published
under the modest title of 'Études sur le Timée de Platon,'
is far and away the ablest and completest edition of the Timaeus
which exists. As an exposition of the philosophical import
of the dialogue I should not be disposed to rate it so very
highly; but so far as it deals with the physical and other
scientific questions discussed and with the numerous grave
difficulties of detail, it is invaluable: the acuteness and in-
genuity, the luminous clearness, and (not least) the unfailing candour of the editor, deserve all admiration. The debt owed to Martin by any subsequent editor must needs be very great. The most recent edition known to me was published in 1853 in the useful series issued by Engelmann at Leipzig, including text, German translation, and rather copious notes. Böckh's 'Specimen editionis' unfortunately is but a small fragment.

The only English translations with which I am acquainted are Thomas Taylor's and Prof. Jowett's: in German there are several. Martin's edition includes a clear and close French rendering, considerably more accurate than Cousin's.

Among the most valuable and important contributions to the explanation of the Timaeus are some writings of August Böckh, especially his admirable treatise 'Ueber das kosmische System des Platon.' It is much to be regretted that so excellent a scholar did not give us a complete edition of the dialogue.

The chief ancient exponent is Proklos, of whose commentary, \( \theta e i x \ \tau i v \ \mu o \lambda \rho a \), only perhaps one third, a fragment of some 850 octavo pages, is extant, breaking off at 44 D. This disquisition is intolerably verbose, often trivial, and not rarely obscure: nevertheless one who has patience to toil through it may gain from it information and sometimes instruction; and through all the mists of neoplatonic fantasy the native acuteness of the writer will often shine.

The principal object of this edition is to examine the philosophical significance of the dialogue and its bearing on the Platonic system. At the same time, seeing that so few sources of aid are open to the student of the Timaeus, I have done my best to throw light upon the subsidiary topics of Plato's discourse, even when they are of little or no philosophical importance; nor have I willingly neglected any detail which seemed to require explanation. But as in the original these details are subordinate to the ontological teaching, so I have regarded their discussion as subordinate to the philosophical interpretation of this magnificent and now too much neglected dialogue.

A translation opposite the text has been given with a view to relieving the notes. The Timaeus is one of the most difficult of Plato's writings in respect of mere language; and had all matters of linguistic exegesis been treated in the commentary,
this would have been swelled to an unwieldy bulk. I have hoped by means of the translation to show in many cases how I thought the Greek should be taken, without writing a grammatical note; though of course it has been impossible to banish such subjects entirely.

My obligation to Dr Jackson's essays on the ideal theory will be manifest to any one who reads both those essays and my commentary. I am as fully as ever convinced of the high importance of his contribution to the interpretation of Plato. In his essay on the Timaeus indeed there are some statements to which I can by no means assent; but as that paper in its present form does not contain Dr Jackson's final expression of opinion, I have not thought it necessary to discuss divergencies of view, which may prove to be very slight, and which do not affect the main thesis for which he is contending.

Lastly I must thank my friend Dr J. W. L. Glaisher for his kindness in examining my notes on the arithmetical passage at the beginning of chapter VII, and for mathematical information in other respects.

Trinity College, Cambridge,

ERRATUM.

P. 204, 1st col. of notes, line 21, cancel as erroneous the words 'And if...as the first.'
INTRODUCTION.

§ 1. Of all the more important Platonic writings probably none has less engaged the attention of modern scholars than the Timaeus. Nor is the reason of this comparative neglect far to seek. The exceeding abstruseness of its metaphysical content, rendered yet more recondite by the constantly allegorical mode of exposition; the abundance of a priori speculation in a domain which experimental science has now claimed for its own; the vast and many-sided comprehensiveness of the design—all have conspired to the end that only a very few of the most zealous students of Plato's philosophy have left us any considerable work on this dialogue. It has been put on one side as a fantastic, if ingenious and poetical, cosmogonical scheme, mingled with oracular fragments of mystical metaphysic and the crude imaginings of scarcely yet infant science.

But this was not the position assigned to the Timaeus by the more ancient thinkers, who lived 'nearer to the king and the truth.' Contrariwise not one of Plato's writings exercised so powerful an influence on subsequent Greek thought; not one was the object of such earnest study, such constant reference. Aristotle criticises it more frequently and copiously than any other dialogue, and perhaps from no other has borrowed so much: Cicero, living amid a very stupor and paralysis of speculative philosophy, was moved to translate it into Latin: Appuleius gives for an account of the Platonic philosophy little else but a partial abstract of the Timaeus, with some ethical supplement from the Republic: Plutarch has sundry more or less elaborate disquisitions on several of the subjects handled in it. As for the neoplatonic school, how completely their thought was dominated by the metaphysic of the Timaeus, despite the incongruous and almost
INTRODUCTION.

monstrous accretions which some of them superimposed, is manifest to any reader of Plotinos or Proklos. Such being the concordance of ancient authorities, is it not worth while to inquire whether they be not justified in attaching so profound a significance to this dialogue?

The object of this essay is to establish that they were justified. No one indeed can read the Timaeus, however casually, without perceiving that in it the great master has given us some of his profoundest thoughts and sublimest utterances: but my aim is to show that in this dialogue we find, as it were, the focus to which the rays of Plato's thought converge; that by a thorough comprehension of it (can we but arrive at this) we may perceive the relation of various parts of the system one to another and its unity as a whole: that in fact the Timaeus, and the Timaeus alone, enables us to recognise Platonism as a complete and coherent scheme of monistic idealism.

I would not be understood to maintain that Plato's whole system is unfolded in the Timaeus; there is no single dialogue of which that could be said. The Timaeus must be pieced together with the other great critical and constructive dialogues of the later period, if we are rightly to apprehend its significance. But what I would maintain is that the Timaeus furnishes us with a master-key, whereby alone we may enter into Plato's secret chambers. Without this it is almost or altogether impossible to find in Platonism a complete whole; with its aid I am convinced that this is to be done. I am far from undervaluing the difficulty of the task I have proposed: but it is worth the attempt, if never so small a fraction may be contributed to the whole result.

With this end in view, it is necessary to consider Plato's intellectual development in relation to certain points in the history of previous Greek philosophy. These points are all notorious enough, but it seems desirable for our present purpose to bring them under review.

§ 2. Now it seems that if we would rightly estimate the task which lay before Plato at the outset of his philosophical career and appreciate the service he has rendered to philosophy, we must throw ourselves back into his position, we must see with his eyes and compute as he would have computed the net result of preplatonic theorising. What is the material which his predecessors had handed down for him to work upon? what are the solid and enduring verities they have brought to light? and

---

Pre-platonic basis of Platonism: Herakleitos, Parmenides, Anaxagoras.
INTRODUCTION.

how far have they amalgamated these into a systematic theory of existence?

In the endeavour to answer these questions I think we can hardly fail to discern amid the goodly company of those early pioneers certain men rising by head and shoulders above their fellows: Herakleitos, Parmenides, Anaxagoras, these three. Each one of these bequeathed to his successors a great principle peculiarly his own; a principle of permanent importance, with which Plato was bound to deal and has dealt. And save in so far as the Pythagorean theory of numbers may have influenced the outward form of his exposition, there is hardly anything in the early philosophy before Sokrates, outside the teaching of these three men, which has seriously contributed to Plato's store of raw material. The synthesis of their one-sided truths required nothing less than the whole machinery of Plato's metaphysical system: it is from their success and their failure that he takes his start—the success of each in enunciating his own truth, the failure of each to recognise its relations.

Since these three men, as I conceive, furnished Plato with his base of operations—or, more correctly perhaps, raised the problems which he must address himself to solve, it is incumbent on us to determine as precisely as we can the nature of the contributions they severally supplied.

§ 3. The old Ionian physicists were all unknowingly working their way to the conception of Becoming. They did not know this, because they knew not that matter, with which alone they were concerned, belonged altogether to the realm of Becoming. Nor yet did they reach this conception, for they had not been able to conceive continuity in change—that is to say, they had not conceived Becoming. They imagined the indefinite diversity of material nature to be the complex manifestations of some uniform underlying element, which, whether by condensation and expansion or by some more fundamental modification of its substance, transmuted itself into this astonishing multiplicity of dissimilar qualities. But according to their notion this underlying element, be it water or air or some indefinable substrate, existed at any given place now in one form, now in another; that is, it abode for a while in one of its manifestations, then changed and abode for a while in another. Air is air for a time; then it is

1 Of course the antithesis of matter and spirit had not yet presented itself to Greek thought.
INTRODUCTION.

condensed and turns to water. Thus the notion of continuity is absent, and consequently the notion of Becoming. Yet, for all that, Thales, Anaximandros, and Anaximenes were on the path to Becoming.

The penetrating intellect of Herakleitos detected the shortcoming of his predecessors. All nature is a single element transmuting itself into countless diversities of form: be it so. But the law or force which governs these transmutations must be omnipresent and perpetually active. For what power is there that shall hold it in abeyance at any time? or how could it intermit its own activity without perishing altogether? Therefore there can be no abiding in one form; transmutation must be everywhere ceaseless and continuous, since nature will not move by leaps. Motion is all-pervading, and rest is there nowhere in the order of things. And this privation of rest is not a matter of degree nor to be measured by intervals of time. Rest during an infinitesimal fraction of the minutest space which our senses can apprehend were as impossible and inconceivable as though it should endure for ages. We must see the ὑπόθεσις ἄνω κάτω as Herakleitos saw it: all nature is a dizzy whirl of change without rest or respite, wherein there is no one thing to which we can point and say 'See, it is this, it is that, it is so.' For in the moment when what we call 'it' has begun to be 'this' or 'that' or 'so,' at that very moment it has begun to pass from the state we thus seek to indicate: there is nowhere a fixed point. And thus Herakleitos attains to the conception of continuity and Becoming. He chose appropriately enough fire, the most mobile and impalpable of the four reputed elements, to be the vehicle of this never resting activity of nature; but it matters nothing what was his material substrate. His great achievement is to have firmly grasped and resolutely enunciated the principle of continuity and hence of Becoming: for continuity is a mode of Becoming, or Becoming a mode of continuity, according as we may choose to view it. Moreover, Herakleitos introduces us to the antithesis of ὂν and μη ὂν. We cannot say of any object 'it is so,' or use any other phrase which implies stability. Yet the thing in some sense or other is, else it would be nothing; it is at any rate a continuity of change. So then the thing is and is not; that is to say, it becomes. Or if, as we watch a falling drop of rain, we take any spot in its course which it would just fill, we can never say 'it is there,' for it never rests: yet, by the
time the drop reaches the earth, that spot has been filled by it. The drop has a 'where,' though we can never define the 'where.' Thus throughout the teaching of Herakleitos the 'is' is confronted by 'is not.'

§ 4. In the preceding paragraph I have confined myself within the limits of the actual teaching of Herakleitos: the Platonic developments of it will occupy our attention later on. What then is the actual result—the contribution to the philosophical capital with which Plato had to start? We have conceived change as continuous, that is, we have conceived Becoming. And Becoming is negation of stable Being. Also since change is a transition, it involves motion: therefore in affirming Becoming we affirm Motion. And since change is a transition from one state to another, it involves plurality. So in affirming Becoming we affirm Multitude. Becoming, Motion, Multitude—these are three aspects of one and the same fact: and this is the side of things which Herakleitos presents to us as the truth and reality of nature. The importance of this aspect cannot be exaggerated, neither can its insufficiency.

§ 5. For where does this doctrine leave us in regard to the acquisition of knowledge? Surely of all men most hopeless. Let us set aside for the present the question of the relation between subject and object as elaborated in the Thaeetetus, and confine ourselves simply to the following considerations. The object of knowledge must exist: of that which is not there can be no knowledge. But we have seen that according to Herakleitos it is as true to say of everything that it is not as to say that it is: therefore at best it is as true that there is no knowledge as that there is. Again the object of knowledge must be abiding: how can the soul have cognisance of that which unceasingly slips away and glides from her grasp? For it is not possible that we cognise our elemental substrate now in one form, now in another, since change is continuous: there is no footing anywhere; for each thing the beginning of birth is the beginning of dissolution; every new form in the act of supplanting the old has begun its own destruction. In this utter elusiveness of fluidity where is knowledge to rest? Plato sums up the matter in these words: εἰ μὲν γὰρ αὐτὸ τοῦτο, ἡ γνώσις, τοῦ γνώσεως εἶναι μὴ μεταπίπτει, μένοι τὲ ἂν ἂεὶ ἡ γνώσις καὶ εἰ ἡ γνώσις: εἰ δὲ καὶ αὐτὸ τὸ εἷδος μεταπίπτει τῆς γνώσεως, ἀμα τ' ἂν μεταπίπτοι εἰς ἄλλο εἴδος γνώσεως καὶ οὔκ ἂν εἰ ἡ γνώσις: εἰ δὲ ἂεὶ μεταπίπτει, ἂεὶ οὐκ ἂν εἰ ἡ
6. \textit{Introduction.}

Thus the teaching of Herakleitos tends to one inevitable end—none can know, for nothing can be known.

§ 6. Seeing then that Becoming and Multitude are unknowable, are we therefore forced to abandon in despair all striving after knowledge? Or is it perchance possible that there exists Being or Unity, which abides for ever sure and can be really and certainly known? Such at least was the conviction of Parmenides.

This great philosopher, who may be considered as the earliest herald of the idealism which should come but yet was not, set about his work by a method widely different from that of the Ionian physicists\textsuperscript{1}. The Ionians indeed, and even Herakleitos himself, in a certain sense sought unity, inasmuch as they postulated one single element as the substrate of material phenomena. But such a unity could not content Parmenides. What, he may have asked, do we gain by such a unity? If there is one element underlying the appearances of material nature, why choose one of its manifestations as the fundamental form in preference to another? If the same substance appears now as fire, now as air, now as water, what is the use of saying that fire, air, or water is the ultimate element? And if with Anaximandros we affirm that the ultimate substance is an undefined unlimited substrate, this is only as much as to say, we do not know the substrate of things. In any case the supposition of a material substrate leaves us just where we were. The unity that pervades nature must be one of a totally different sort; not a material element which is transformed into multitudinous semblances, but a principle, a formative essence, distinct from the endless variety of visible nature. It must be no ever-changing substrate, but an essence simple, immutable, and eternal, far removed from the ken of sensation and to be reached by reason alone. And not only must it be verily existent, it must be the sum-total of existence; else would it fail of its own nature and fall short of itself. Since then the One is and is the whole, it must needs follow that the Many are not at all. Material nature then, with all her processes and appearances, is utterly non-existent, a vain delusion of the senses: she is Not-being, and Not-being exists in no wise—only Being is. And since

\textsuperscript{1} I take Parmenides as the representative of Eleatic thought, regarding Xenophanes as not, properly speaking, a philosopher at all, and Zeno as merely developing one aspect of Parmenidean teaching.
Not-being is not, neither is there Becoming; for Becoming is the synthesis of Being and Not-being. Again if there is not Becoming, Motion exists not either, for Becoming is a motion, and all motion is becoming. Multitude, Motion, Becoming—all these are utterly obliterated from out of the nature of things: only the One exists, abiding in its changeless eternity of stillness.

§ 7. Such is the answer returned by Parmenides and his school to the question asked at the beginning of our previous section. Material nature is in continual flux, you say, and cannot be known: good—then material nature does not exist. But Being or the One does exist and can be known, and it is all there is to know.

Now it is impossible to conceive a sharper antithesis than that which exists at all points between the two theories I have just sketched. The Heracleiteans flatly deny all unity and rest, the Eleatics as flatly deny all plurality and motion. If then either of these schools is entirely right, the law of contradiction is peremptory—the other must be entirely wrong. Is then either entirely right or wrong?

We have already admitted that Heracleiteanism presents us with a most significant truth, and also that it remorselessly sweeps away all basis of knowledge. Therefore we conclude that, though Heracleitos has given us a truth, it is an incomplete and one-sided truth. Let us notice next how the Eleatics stand in this respect.

About the inestimable value of the Eleatic contribution there can be no doubt. Granted that the phenomena of the material world are ever fleeting and vanishing and can never be known—what of that? The material world does not really exist: it is not there that we must seek for the object of knowledge, but in the eternally existent Unity. Thus they oppose the object of reason

1 This sheer opposition of the existent unity to the non-existent plurality led Parmenides to divide his treatise on Nature into two distinct portions, dealing with Truth and Opinion. I am not disposed to contest Dr Jackson's affirmation that 'Parmenides, while he denied the real existence of plurality, recognised its apparent existence, and consequently, however little value he might attach to opinion, was bound to take account of it'. That Parmenides was perfectly consistent in embracing the objects of Opinion in his account, I admit. But none the less does his language justify the statements in the text: he emphatically affirms the non-existence of phenomena, and has no care to explain why they appear to exist.

The Eleatic theory, taken by itself, is as inadequate as that of Heracleitos.
to the object of sensation. This is good, so far as it goes: it points to the line followed by Plato, who said, if material nature cannot be known, the inference is, not that knowledge is impossible, but that there is some immaterial existence, transcending the material, which is the true object of knowledge. But the further we examine the Eleatic solution, the more reason we shall see to be dissatisfied with it. First the problem of the material world is not answered but merely shelved by the negation of its existence. Here are we, a number of conscious intelligences, who perceive, or fancy we perceive, a nature which is not ourselves. What then are we, what is this nature, why do we seem to perceive it, and how can there be interaction between us and it? A bald negation of matter will not satisfy these difficulties. Again, the Eleatics are bound to deny not merely the plurality of objects, but the plurality of subjects as well. What then are these conscious personalities, which seem so real and so separate, and which yet on Eleatic principles must, so far as their plurality and their separation is concerned, be an idle dream? Secondly, if we ask Parmenides what is this eternally existent One, no satisfactory answer is forthcoming. On the one hand his description of the ἐν ὅν πᾶν is clogged with the forms of materiality: it is 'on all sides like unto the globe of a well-rounded sphere, everywhere in equipoise from the centre:' on the other, it is a mere aggregate of negations, and, as Plato has shown, an idle phantom of the imagination, an abstraction without content, whereof nothing can be predicated, which has no possible mode of existence, which cannot be spoken, conceived, or known. This is all Parmenides has to offer us for veritable existence. If it is true that on Herakleitean principles nothing can be known, it is equally true that on Eleatic principles there is nothing to know.

§ 8. How is it then that either of these most opposite theories leads to an equally hopeless deadlock? It is because each of them presents us with one side of a truth as if it were the whole. For opposite as the doctrines of Herakleitos and Parmenides may appear, they are in fact mutually complementary, and neither is actually true except in conjunction with its rival. Herakleitos did well in affirming Motion; but he forgot that, if Motion is to be, there must likewise be Rest: for opposite requires opposite. So too Parmenides in denying plurality saw not that he thereby abolished unity: for One and Many can exist only in mutual correlation—each is meaningless without the other. Both must
exist, or neither: the two are as inseparable as concave and convex.

Here then lies the radical difference between Parmenides and Plato. Parmenides said, Being is at rest, therefore Motion is not; Being is one, therefore Multitude is not; Being is, therefore Not-being is not at all. Plato said, since there is Rest, there must be Motion; since Being is one, it must also be many; that Being may really be, Not-being must also be real. The chasm between the two sides must be bridged, the antinomy conciliated: Rest must agree with Motion, Unity with Multitude, Being with Not-being.

But, it may be objected, is not this the very thing we just now said that the theory of Herakleitos achieved? is not his great merit to have shown that each thing becomes, that is to say, it is at once and is not? True, Herakleitos shows this in the case of particulars: he exhibits 'is' and 'is not' combined in the processes of material nature. But as his universal result he gives us the negation of Being, just as Parmenides gives us the negation of Not-Being: each in the universal is one-sided. This Becoming, to which Herakleitos points in the material world, must be the symbol of a far profounder truth, of which Herakleitos never dreamed, which even Plato failed at first to realise.

So then these are our results up to the present point. On the one side we have Multitude, Motion, Becoming; on the other Unity, Rest, Being. The two rival principles confront each other in sheer opposition, stiff, unyielding, impracticable. And till they can be reconciled, human thought is at a standstill. The partisans of either side waste their strength in idle wrangling that ends in nothing. And indeed, as we have them so far, these two principles are hopelessly conflicting: some all-powerful solvent must be found which shall be able to subdue them and hold them in coalescence. Now this very thing is the contribution of the last of the three great thinkers who are at present under consideration: he brought into the light, though he could not use, the medium wherein the fundamental antithesis of things was to be reconciled.

§ 9. Anaxagoras belongs to the Ionian school of thought and mainly concerned himself with physics. But such was the originality of his genius and such the importance of his service to philosophy that he stands forth from the rest, as prominent and imposing a figure as Herakleitos himself. With his physical
theories we are not now concerned, since it is the development of Greek metaphysic alone which we are engaged in tracing. Anaxagoras distinguished himself by the postulation of Mind as an efficient cause: therefore it is that Aristotle says he came speaking the words of soberness after men that idly babbled. All was chaos, says Anaxagoras, till Mind came and ordered it. Now what is the meaning of this saying, as he understood it?

First we must observe that the teaching of Anaxagoras is not antithetical to that of either Herakleitos or Parmenides, as these two are to each other: he takes up new ground altogether. His doctrine of νόεσ is antagonistic to the opinions of Empedokles and of the atomists. Empedokles assumes Love and Hate as the causes of union and disunion. But herein he really introduces nothing new; he merely gives a poetical half-personification to the forces which are at work in nature. The atomists, conceiving their elemental bodies darting endlessly through infinite space, assigned as the cause of their collision τῦχη or ἀνύγη, by which they meant an inevitable law operating without design, a blind force inherent in nature. This is what Anaxagoras gainsaid: to him effect required a cause, motion a movent. Now he observed that within his experience individual minds are the cause of action: what more likely then, he argued, than that the motions of nature as a whole are caused by a universal mind? It did not seem probable to him that a universe ordered as this is could be the chance product of blindly moving particles; he thought he saw in it evidence of intelligent design. He knew of but one form of intelligence—the mind of living creatures, and chiefly of man. Mind then, he thought, must be the originator of order in the universe—a mind transcending the human intelligence by so much as the operations of nature are mightier than the works of man. Thus then he postulated an efficient cause distinct from the visible nature which it governed.

This leads us briefly to compare his attitude towards causation with that of Herakleitos and Parmenides. Herakleitos sought for no efficient cause. The impulse of transmutation is inherent in his elemental fire, and he looks no further. Why things are in perpetual mutation is a question which he does not profess to answer; it is enough, he would say, to have affirmed a principle that will account for the phenomena of the universe: it is neither necessary nor possible to supply a reason why the universe exists on this principle. And in fact every philosophy
must at some point or other return the same reply. Herakleitost then conceives a motive force to exist in matter, but seeks not any ulterior cause thereof.

The Eleatics simply abolished causation altogether. Since the One alone exists and changes never, it is the cause of nothing either to itself or to anything else. Causation in fact implies Becoming, and is thus excluded from the Eleatic system. No attempt is made to establish any relation of causality between the One and the Many, since the latter are absolutely negated. Nor does Parmenides in his treatise on the objects of Opinion make any effort to account for the apparent existence of the multitude of material particulars.

Anaxagoras is thus the first with whom the conception of an efficient cause came to the front; and herein, however defective may have been his treatment of the subject, his claim of originality is indefeasible.

§ 10. The shortcomings of the Anaxagorean theory have been dwelt upon both by Plato and by Aristotle. Plato found indeed much in Anaxagoras with which he could sympathise. His conception that Intelligence, as opposed to the atomistic ἀναγκή, is the motive cause in nature, is after Plato's own heart. But after advancing so far, Anaxagoras stops short. Plato complains that he employs his Intelligence simply as a mechanical cause, as a source of energy, whereby he may have his cosmical system set in motion. But if, says Plato, the ἀρχή of the universe is an intelligent mind, this must necessarily be ever aiming at the best in its ordering of the universe—no explanation can be adequate which is not thoroughly teleological. But Anaxagoras does not represent 'the best' as the cause why things are as they are: having assumed his νοῦς as a motive power, he then, like all the rest, assigns only physical and subsidiary causes. The final cause has in fact no place in the philosophy of Anaxagoras. Nor does he ever regard Mind as the indwelling and quickening essence of Nature, far less as her substance and reality. On the contrary Mind is but an external motive power supplying the necessary impetus whereby the universe may be constructed on mechanical principles. Material phenomena stand over against it as an independent existence; they are ordered and controlled by Mind, but are not evolved from it, nor in any way conciliated with it. Thus we see how far Anaxagoras was from realising the immeasurable importance of the principle which he
INTRODUCTION.

himself contributed to metaphysics, the conception of a causative mind. And so his philosophy ends in a dualism of the crudest type.

§ II. And now we have lying before us the materials out of which, with the aid of a hint or two gained from Sokrates, Plato was to construct an idealistic philosophy. These materials consist of the three principles enunciated by the three great teachers whose views we have been considering. These principles we may term by different names according to the mode of viewing them—Motion, Rest, Life; Multiplicity, Unity, Thought; Becoming, Being, Soul: all these triads amount to the same. But however pregnant with truth these conceptions may prove to be, they are thus far impotent and sterile to the utmost. Each is presented to us in helpless isolation, incapable by itself of affording an explanation of things or a basis of knowledge. To bring them to light was only for men of genius, rightly to conciliate and coordinate them required the supreme genius of all. Like the bow of Odysseus, they await the hand of the master who alone can wield them. The One of Parmenides and the Many of Herakleitos must be united in the Mind of Anaxagoras: that is to say, unity and plurality must be shown as two necessary and inseparable modes of soul’s existence, before a philosophy can arise that is indeed worthy of the name. And it is very necessary to realise that to all appearance nothing could be more hopeless than the deadlock at which philosophical speculation had arrived: every way seemed to have been tried, and not one led to know-

1 It may be thought strange that I here make no mention of the Pythagoreans. But the Pythagorean influence on Platonism has been grossly overrated. Far too much importance has often been attached to the statements of late and untrustworthy authorities, or to fragments attributed on most unsubstantial grounds to Pythagorean writers. All that we can safely believe about Pythagorean philosophising is to be found, apart from what Plato tells us, in Aristotle: and from his statements we may pretty fairly infer that they had no real metaphysical system at all. There is indeed some superficial resemblance between the Pythagorean theory of numbers and the Platonic theory of ideas—a resemblance sufficient to induce Aristotle to draw a comparison between them in the first book of the metaphysics. But that the similarity was merely external is plain from Aristotle’s own account, and also that the significance to be attached to the Pythagorean numbers had been left in an obscurity which probably could not have been cleared up by the authors of the theory. We may doubtless accept the verdict of Aristotle in a somewhat wider sense than he meant by the words—μαν ἀπλως ἐπαγματεύθησαν.
ledge. The natural result was that men despaired of attaining philosophic truth.

§ 12. Before we proceed further, perhaps a few words are due to Empedokles. For he seems to have been dimly conscious of the necessity to amalgamate somehow or other the principles which Herakleitos and Parmenides had enunciated, the principles of Rest and Motion. But of any scientific method whereby this should be done he had not the most distant conception. His scheme is crudely physical, a mere mechanical juxtaposition of the two opposites—μικτές διαλλαξίες τε μιγάτων: a real ontological fusion of them was utterly beyond his thought. Still, although he really contributes nothing to the solution of the problem concerning the One and Many, the fact that he did grope as it were in darkness after it is worthy of notice.

§ 13. The hopelessness of discovering any certain verity concerning the nature of things found an expression in the sophist movement. This phase of Greek thought need not detain us long, since it did nothing directly for the advancement of metaphysical inquiry. It is possible enough that the new turn which the sophists gave to men’s thoughts may have done something to prepare the way for psychological introspection, and their studies in grammar and language can hardly have been other than beneficial to the nascent science of logic. From our present point of view however the only member of the profession that need be mentioned is Protagoras, who was probably the clearest and acutest thinker among them all, and who is interesting because Plato has associated his name with some of his own developments of the Herakleitean theory. The historical Protagoras probably did little or nothing more in this direction than to popularise some of the teaching of Herakleitos and to give it a practical turn. What seems true to me, he said, is true for me; what seems true to you is true for you: there is no absolute standard—πάντων χρημάτων μέτρον ἄνθρωπος. Therefore let us abandon all the endeavours to attain objective truth and turn our minds to those practical studies which really profit a man. The genuine interest of the doctrine of the relativity of knowledge, which Protagoras broached, is to be found in Plato’s development of it; and this will be considered in its proper place. So far as concerns our present study, we see in Protagoras only a striking representative of the reaction against the earlier dogmatic philosophy.
§ 14. Into the question whether Sokrates was a sophist or not we are not concerned to enter. And, deep as was the mark which he left on his time, we need not, since our inquiry deals with metaphysics, linger long with him: for whatever metaphysical importance Sokrates possesses is indirect and may be summed up in a very few words. With Sokrates the ultimate object of inquiry is, not the facts given in experience, but our judgments concerning them. Whereas the physicists had thought to attain knowledge by speculation upon the natural phenomena themselves, Sokrates, by proceeding inductively to a classification and definition of various groups of phenomena, substituted concepts for things as the object of cognition. By comparing a number of particulars which fall under the same class, we are enabled to strip off whatever accidental attributes any of them may possess and retain only what is common and essential to all. Thus we arrive at the concept or universal notion of the thing: and since this universal is the sole truth about the thing, so far as we are able to arrive at truth, it follows that only universals are the object of knowledge, so far as we are able to attain it. This Sokratic doctrine, that knowledge is of universals is the germ of the Platonic principle that knowledge is of the ideas: and though, as we shall see, a too close adherence to it led Plato astray at first, it remained, since there was a Plato to develope it, a substantial contribution to philosophical research.

§ 15. We are now in a position to appreciate the nature of the work which lay before Plato and of the materials which he found ready to his hand. We have seen that philosophy, properly speaking, did not yet exist, though the in composite elements of it were there ready for combination. Now it would be a very improbable supposition that Plato realised at first sight the full magnitude and the exact nature of the problem he had to encounter: and a careful study of his works leads, I believe, to the conclusion that such a supposition would be indefensible. If then this is so—if Plato first dealt with the question incompletely and with only a partial knowledge of what he had to do, but afterwards revised and partly remodelled his theory, after he had fully realised the nature of the problem—

1 For a full statement of the reasons for holding that in Plato's dialogues are to be found two well-defined phases of his thought, I must refer to Dr Jackson's essays on the later theory of ideas.
obviously our business is to investigate his mode of operation at both stages: we must see how he endeavoured in the first instance to escape from the philosophical scepticism which seemed to be the inevitable result of previous speculation, what were the deficiencies he found in the earlier form of his theory, and how he proposed to remedy its faults. We must see too how far his conception of the nature of the problem may have altered in the interval between the earlier and the later phase of the ideal theory.

To this end it will be necessary to examine Plato's metaphysical teaching as propounded in a group of dialogues, whereof the most important metaphysically are the Republic and Phaedo—with which are in accordance the Phaedrus, Symposium, Meno, and apparently the Cratylus—and next the amended form of their teaching, as it appears in four great dialogues of the later period, Parmenides, Sophist, Philebus, Timaeus; especially of course the last. The Sokratic dialogues may be dismissed as not bearing upon our question.

§ 16. Plato had thoroughly assimilated the physical teaching of Herakleitos. He held no less strongly than the Ionian philosopher the utter instability and fluidity of material nature. We are not perhaps at liberty to allege the very emphatic language of the Theaetetus as evidence that this was his view in the earlier phase of his philosophy, with which we are at present dealing: but there is abundant proof within the limits of the Republic and Phaedo: see Republic 479 B, Phaedo 78 B. He therefore, like Protagoras, was bound to draw his inference from the Herakleitean principle. The inference drawn by Protagoras was that speculation is idle, knowledge impossible. The inference drawn by Plato was that, since matter cannot be known, there must be some essence transcending matter, which alone is the object of knowledge. And furthermore this immaterial essence must be the cause and sole reality of material phenomena. Thus it was Plato's acceptance of the Herakleitean πάντα ἔν, together with his refusal to infer from it the impossibility of knowledge, that led him to idealism.

At this point the hint from Sokrates is worked in. What manner of immaterial essence is it which we are to seek as the object of knowledge? Plato cordially adopted the Sokratic principle that universals alone can be known. But the Sokratic universal, being no substantial existence but merely a conception in our own mind, will not meet Plato's demand for a
self-existent intelligible essence. Plato therefore hypostatises the Sokratic concept, declaring that every such concept is but our mental adumbration of an eternal and immutable idea. Thus in every class of material things we have an idea, whereof the particulars are the material images, and the concept which we form from observation of the particulars is our mental image of it. Immaterial essence then exists in the mode of eternal ideas or forms, one of which corresponds to every class, not only of concrete things, but of attributes and relations,—of all things in fact which we call by the same class-name (Republic 596 A). The particulars exist, so far as they may be said to exist, through inherence of the ideas in them—at least this is the way Plato usually puts it, though in Phaedo 100 D he declines to commit himself to a definition of the relation. These ideas are arranged in an ascending scale: lowest we have the ideas of concrete things, next those of abstract qualities, and finally the supreme Idea of the Good, which is the cause of existence to all the other ideas, and hence to material nature as well.

Now since, as we have seen, there is an idea corresponding to every group of particulars, we may note the following classes of ideas in the theory of the Republic: (1) the idea of the good; (2) ideas of qualities akin to the good, καλόν, δίκαιον and the like; (3) ideas of natural objects, as man, horse; (4) ideas of σκευαστά, such as beds or tables; (5) ideas of relations, as equal, like; (6) ideas of qualities antagonistic to good, ἄδικον, ἀληχρόν, and so forth (Republic 476 A).

Thus then we have the multitude of particulars falling under the above six classes deriving their existence from a number of causative immaterial essences, which in turn derive their own existence from one supreme essence, to wit, the idea of the good. The particulars themselves cannot be known, because they have no abiding existence: but by observation and classification of the particulars we may ascend from concept to concept until we attain to the apprehension of the αὐτὸ ἀγαθόν, whence we pass to the cognition of the other ideas. Thus Plato offers us a theory of knowledge which shall enable us to escape from metaphysical scepticism. But he also offers us in the theory of ideas his solution of a pressing logical difficulty—the difficulty raised by Antisthenes and others as to the possibility of predication. The application of the ideal theory to this question is to be found in Phaedo 102 B. Predication signifies that the idea of the quality predicated is
INTRODUCTION.

inherent in the subject whereof it is predicated: if we say 'Sokrates is small,' we do not, as Antisthenes would have it, identify 'Sokrates' and 'small,' but simply indicate that Sokrates partakes of the inherent idea of smallness. Thus we find in the doctrine of ideas on the metaphysical side a theory of knowledge, on the logical side a theory of predication.

§ 17. Such is Plato's first essay to solve the riddle bequeathed him by his predecessors. Let us try to estimate the merits and deficiencies of his solution.

The bold originality of Plato's theory is conspicuous at a glance. In the first place, by proclaiming the Absolute Good as the sole source of existence, he identifies the ontological with the ethical first principle, the formal with the final cause. Thus he makes good the defect whereof he complained in the philosophy of Anaxagoras. For in the Platonic system a theory of being is most intimately bound up with a theory of final causes: ontology and teleology go hand in hand. Everything exists exactly in proportion as it fulfils the end of being as perfect as possible; for just in that degree it participates in the idea of the good, which is the ultimate source of all existence. In just the same way he escapes from the utilitarian doctrine of Protagoras, by deducing his ethical teaching from the very fount of existence itself. Thus he finds one and the same cause for the existence of each thing and for its goodness. A good thing is not merely good relatively to us: as it exists by participating in the idea of the good, so it is good by resembling the idea; the participation is the cause of the resemblance. Hence good is identified with existence, evil with non-existence; and, as I have said, each thing exists just in so far as it is good, and no further.

Again in the ideal theory we for the first time reach a conception, and a very distinct conception, of immaterial existence. Perhaps we are a little liable to be backward in realising what a huge stride in advance this was. I will venture to affirm that there is not one shadow of evidence in all that we possess of preplatonic utterances to show that any one of Plato's predecessors had ever so remote a notion of immateriality. Parmenides, who would gladly have welcomed idealism, is as much to seek as any one in his conception of it. And when we see such a man as Parmenides 'the reverend and awful' with all his 'noble profundity' hopelessly left behind, we may realise what an invincible genius it was that shook from its wings the materialistic bonds that clogged

P. T.
both thought and speech and rose triumphant to the sphere of the 'colourless and formless and intangible essence which none but reason the soul's pilot is permitted to behold.'

And as the material and immaterial are for the first time distinguished, so between perception and thought is the line for the first time clearly drawn. Perception is the soul's activity as conditioned by her material environment; thought her unfettered action according to her own nature: by the former she deals with the unsubstantial flux of phenomena, by the latter with the immutable ideas.

Plato then recognises and already seeks to conciliate the conflicting principles of Herakleitos and Parmenides. He satisfies the demand of the Eleatics for a stable and uniform object of cognition, while he concedes to Herakleitos that in the material world all is becoming, and to Protagoras that of this material world there can be no knowledge nor objective truth. He also affirms with Anaxagoras that mind or soul is the only motive power in nature—soul alone having her motion of herself is the cause of motion to all things else that are moved. Thus we see that Plato has taken up into his philosophy the great principles enounced by his forerunners and given them a significance and validity which they never had before.

§ 18. Now had Plato stopped short with the elaboration of the philosophical scheme of which an outline has just been given, his service to philosophy would doubtless have been immense and would still probably have exceeded the performance of any one man besides. But he does not stop short there—nay, he is barely half way on his journey. We have now to consider what defects he discovered in the earlier form of his theory, and how he set about amending them.

First we must observe that the conciliation of Herakleitos and Parmenides is only just begun. It is in fact clear that Plato, although recognising the truth inherent in each of the rival theories, had, when he wrote the Republic, no idea how completely interdependent were the two truths. For in the Republic his concern is, not how he may harmonise the Herakleitean and Eleatic principles as parts of one truth, but how, while satisfying the just claims of Becoming, he may establish a science of Being. He simply makes his escape from the Herakleitean world of Becoming into an Eleatic world of Being. And the world of Becoming is for him a mere superfluity, he does not recognise it as an
inevitable concomitant of the world of Being. This amounts to saying that he does not yet recognise the Many as the inevitable counterpart to the One.

Plato is in fact still too Eleatic. He does not roundly reject the material world altogether: he sees that some explanation of it is necessary, and endeavours to explain it as deriving a kind of dubious existence from the ideas. But this part of his theory was, as he himself seems conscious, quite vague and shadowy: the existence or appearance of material nature is left almost as great a mystery as ever. And, as we shall see, the nature of the ideas themselves is not satisfactorily made out, still less their relation to the αὐτῶν ἀγαθῶν.

Plato is also too Sokratic. He allows the Sokratic element in his system to carry weight which oversets the balance of the whole. We have seen that, owing to his admission of a hypostasis corresponding to every Sokratic concept, we have among the denizens of the ideal world ideas of σχευασία, of relations, and of things that are evil. In the first place the proposition that there exist in nature eternal types of artificial things seems very dubious metaphysic. Again, we have only to read the Phaedo in order to perceive what perplexities beset the ideas of relations. Finally, the derivation from the supreme good of ideal evil is a difficulty exceeding in gravity all the rest. Clearly then the list of ideas needs revision.

Moreover but scant justice is done to the Anaxagorean principle of νοῦς. Plato had indeed supplied the teleological deficiency of Anaxagoras; but we have no hint yet of soul as the substance and truth of all nature, spiritual and material, nor of the conciliation of unity and multitude as modes of soul's existence. Nor have we any adequate theory to explain the relation of particular souls to phenomena and to the ideas. Even the Herakleitean principle itself is not carried deep enough. It is not sufficient to recognise its universal validity in the world of matter. For if there be any truth in Becoming, this must lie deeper than the mere mutability of the material world: the changefulness of matter must be some expression of changeless truth.

I conceive then we may expect to see in Plato's revised theory (1) a more drastic treatment of the problem concerning the One and the Many, (2) a searching inquiry into the relation between ideas and particulars, (3) a large expurgation of the list

1 For instance Phaedo 102 b.
INTRODUCTION.

of ideas, (4) a theory of the relation of soul, universal and particular, to the universe. The answer to these problems may be latent in the earlier Platonism: but Plato has not yet realised the possibilities of his theory. By the time he has done this, we find most important modifications effected in it. Still they are but modifications: Plato's theory remains the theory of ideas, and none other, to the end.

§ 90. The severe and searching criticism to which Plato subjects his own theory is begun in the Parmenides. This remarkable dialogue falls into two divisions of very unequal length. In the first part Parmenides criticises the earlier form of the theory of ideas; in the second he applies himself to the investigation of the One, and of the consequences which ensue from the assumption either of its existence or of its non-existence. The discussion of the ideal theory in the first part turns upon the relation between idea and particulars. Sokrates offers several alternative suggestions as to the nature of this relation, all of which Parmenides shows to be subject to the same or similar objections. The purport of his criticisms may be summed up as follows: (1) if particulars participate in the idea, each particular must contain either the whole idea or a part of it; in the one case the idea exists as a number of separate wholes, in the other it is split up into fractions; and, whichever alternative we accept, the unity of the idea is equally sacrificed: (2) we have the difficulty known as the τρίτος ανθρώπος—if all things which are like one another are like by virtue of participation in the same idea, then, since idea and particulars resemble each other, they must do so by virtue of resembling some higher idea which comprehends both idea and particulars, and so forth εἰς ἀπειρον: (3) if the ideas are absolute substantial existences, there can be no relation between them and the world of particulars: ideas are related to ideas, particulars to particulars; intelligences which apprehend ideas cannot apprehend particulars, and vice versa. It may be observed that the second objection is not aimed at the proposition that particulars resemble one another because they resemble the same idea, but against the hypothesis that because particulars in a given group resemble each other it is necessary to assume an idea corresponding to that group.

Sokrates is unable to parry these attacks upon his theory, but in the second part of the dialogue Plato already prepares a way of escape. In the eight hypotheses comprised in this section of the dialogue Parmenides examines τὸ ἐπ', conceived in several different
INTRODUCTION.

senses with the view of ascertaining what are the consequences both of the affirmation and of the negation of its existence to τὸ ἐν itself and to τὰλλα τῶν ἐνῶν. The result is that in some cases both, in other cases neither, of two strings of contradictory epithets can be predicated of τὸ ἐν or of τὰλλα. If both series of epithets can be predicated, τὸ ἐν can be thought and known, if neither, it cannot be thought nor known. Now in the latter category we find a conception of ἐν corresponding to the Eleatic One and to the idea of the earlier Platonism.

The positive result of the Parmenides then is that the ideal theory must be so revised as to be delivered from the objections formulated in the first part: the second part points the direction which reform is to take. We must give up looking upon One and Many, like and unlike, and so forth, as irreconcilable opposites: we must conceive them as coexisting and mutually complementary. Thus is clearly struck the keynote of the later Platonism, the conciliation of contraries. In this way Plato now evinces his perfect consciousness of the necessity to harmonise the principles of his Ionian and Eleate forerunners, giving to each its due and equal share of importance.

§ 20. It will be convenient to take the Theaetetus next. This dialogue, starting from the question what is knowledge, presents us with Plato’s theory of perception—a theory which entirely harmonises with the teaching of the Timaeus and in part supplements it. This theory Plato evolves by grafting the μέτρον ἄνθρωπος of Protagoras upon the πάντα ἡμί of Herakleitos and developing both in his own way. As finally stated, it is as complete a doctrine of relativity as can well be conceived. What is given in our experience is no objective existence external to us; between the percipient and the object are generated perception on the side of the percipient and a percept on the side of the object: e.g. on the part of the object the quality of whiteness, on the part of the subject the perception of white. And subject and object are inseparably correlated and exist only in mutual connexion—subject cannot be percipient without object, nor object

1 For a detailed investigation of the intricate reasoning contained in this part of the dialogue see Dr Jackson’s excellent paper in the Journal of Philology, vol. xii p. 287.

2 Dr Jackson’s arguments for including the Theaetetus in its present form among the later dialogues appear to me irresistible, although parts of the dialogue have such decided literary affinity to some of the earlier series that I am disposed to entertain the supposition that what we possess is a second and revised edition.
generate a percept without subject. And subject as well as object is undergoing perpetual mutation: thus, since a change either of object or of subject singly involves a change in the perception, every perception is continually suffering a twofold alteration. Perception is therefore an ever-flowing stream, incessantly changing its character in correspondence with the changes in subject and in object. Nothing therefore can be more complete than the absolute instability of our sensuous perceptions. The importance of this theory will be better realised when we view it in the light of the *Timaeus*.

§ 21. More important than even the *Parmenides* is the *Sophist*, one of the most profound and far-reaching of Plato's works. Plato starts with an endeavour to define the sophist, who, when accused of teaching what seems to be but is not knowledge, turns upon us, protesting the impossibility of predicated not-being: it is nonsense to say he teaches what is not, for τὸ μὴ ὄν can neither be thought nor uttered. Hereupon follows a truly masterly examination into the logic of being and not-being. The result is to show that either of the two, viewed in the abstract and apart from the other, is self-contradictory and unthinkable. And as being cannot exist without not-being, so unity also, if it is to have any intelligible existence, must contain in itself the element of plurality; one is at the same time one and not-one, else it has no meaning. The failure to grasp this truth is the fundamental flaw in Eleatic metaphysics and consequently in the earlier ideal theory. It seems to me hardly open to doubt that the *εἴδων φίλοι* of 248 a represent Plato's own earlier views. The strictures he passes upon these *εἴδη* are just those to which we have seen that the incomplete ideal theory is liable. He shows that the absolute immobility of the *εἴδη*, to which all action and passion are denied, renders them nugatory as ontological principles—they are empty and lifeless abstractions: yet, says Plato, a principle of Being must surely have life and thought—249 a. Next he takes five of the *μέγιστα γένη*, as he calls them, Rest, Motion, Same, Other, Being; and he demonstrates their inter-communicability, total or partial. The deduction from this is that such relations are not αὐτὰ καθ’ αὐτὰ εἴδη, or self-existing essences, but forms of predication, or, as we might say, categories. Thus the ideas of relations which gave us so much trouble are swept away; for were these *γένη* substantial ideas, they could not thus be intercommunicable. Finally, the sophistic puzzle about μὴ ὄν
INTRODUCTION.

is disposed of by resolving the notion of negation into that of difference: μὴ ὑπὲρ is simply ἕτερον.

The foregoing statement, brief and general as it is, will suffice, I think, for enabling us to estimate the extent of the contribution made by this dialogue towards building up the revised system. We have (1) the overthrow of the Eleatic conception of being and unity, which warns us that the ideal theory, if it would stand, must abandon its Eleatic character, (2) the most important declaration that Being must have life and thought—this of course implies that the only Being is soul, and points to the universal soul of the Timaeus, (3) the deposition of relations from the rank of ideas, (4) the dissipation of all the fogs that had gathered about the notion of μὴ ὑπὲρ, and the affirmation that there is a sense in which not-being exists. The Sophist, it may be observed, does for the logical side of Being and Not-being very much what the Timaeus does for the metaphysical side. There is much besides which is important and instructive in this dialogue, but I believe I have summed up its main contributions to the later metaphysic.

§ 22. The Sophist then has expunged relations from the list of ideas. But there is another class of ideas included in the earlier system which is not expressly dealt with in any one of the later dialogues, and which it may be as well to mention here. We have seen reason to desire the abolition of ideas of σκευαστά. Now so far as Plato's own statements are concerned, the abandonment of these ideas is only inferential. There is continual reference to such ideas in the earlier dialogues, but absolutely none in the later. This would perhaps sufficiently justify us in deducing the absence of σκευαστά in the revised list of ideas. But we have in addition the distinct testimony of Aristotle on this point. See metaphysics A iii 1070a 18 διὸ δὴ οὐ κακῶς ὁ Πλάτων ἐφῄ στι εἰθῆ ἵστυ ὑπόσα φύσει, with which compare A ix 991b 6 οἷον οἰκία καὶ δακτύλιος, ὅν οὐ φανερ εἰσὶν εἰναί. We know that in the earlier period Plato did recognise ideas of οἰκία and δακτύλιος: therefore Aristotle, in denying such ideas, must have the later period in his mind. In just the same way we read in metaphysics A ix 990b 16 οἴ μὲν τῶν πρὸς τι ποιοῦσιν ἴδεας, ὅν οὐ φαμεν εἰναί καθ' αὐτὸ γένος. Relations were undoubtedly included among the ideas of the earlier period; yet, since, as we have seen, they are rejected in the later, Aristotle simply denies their existence without reference to the earlier view.
INTRODUCTION.

Thus then, sweeping away all ideas of σκευαστά, we are able to affirm that in Plato’s later metaphysic there are ideas corresponding only to classes of particulars which are determined by nature, and none corresponding to artificial groups.

§ 23. In the Philebus we come for the first time to constructive ontology. We have the entire universe classed under four heads—Limit, πέρας—the Unlimited, ἀπειρόν—the Limited, μικτόν—the Cause of limitation, αἰτία τῆς μικτοῦ. In this classification πέρας is form, as such; ἀπειρόν is matter, as such; μικτόν is matter defined by form; αἰτία τῆς μικτοῦ is the efficient cause which brings this information to pass: and this efficient cause is declared to be the universal Intelligence or νοῦς. The objects of material nature are the result of a union between a principle of form and a formless substrate, the latter being indeterminate and ready to accept impartially any determination that is impressed upon it. It is not indeed correct to say that the ἀπειρόν of the Philebus is altogether formless: it is indeterminately qualified, and the πέρας does but define the quantity. For example, ἀπειρόν is ‘hotter and colder,’ that is, indeterminate in respect of temperature: the effect of the πέρας is to determine the temperature. The result of this determination is μικτόν, i.e. a substance possessing a definite degree of heat. The analysis of the material element given in the Philebus therefore falls far short, as we shall see, of the analysis in the Timaeus.

It is not however the πέρας itself which informs the ἀπειρόν: Plato speaks of the informing element as πέρας ἔχον, or πέρατος γέννα. This it is which enters into combination with matter, not the πέρας itself. What then is the πέρας ἔχον? I think we cannot err in identifying it with the εἰσίόντα καὶ ἐξίόντα of the Timaeus; i.e. the forms which enter into the formless substrate, generating μικτήματα of the ideas, and which vanish from thence again. The πέρας ἔχον will then be the Aristotelian εἶδος—the form inherent in all qualified things and having no separate existence apart from things. Every sensible thing then consists of two elements, logically distinguishable but actually inseparable, form and matter. Nowhere in the material universe do we find form without matter or matter without form. Form then or limit, as manifested in material objects, must be carefully distinguished from the absolute πέρας itself, which does not enter into communion with matter: but every πέρας ἔχον possesses the principle of limitation, which it imposes upon the ἀπειρόν wherewith it is combined.
INTRODUCTION.

But what is the πέρας itself? I think we are not in a position to answer this question until we have considered the Timaeus. But the nature of the reply has been indicated by a hint given us in the Parmenides, viz. that the ideas are παράδειγματα ἐστῶτα ἐν τῇ φύσει. For the πέρας ἔχον, by imposing limit, so far assimilates the ἀπειρων to the πέρας; consequently the μικτὸν is the μίμημα of the πέρας as παράδειγμα. We may therefore regard the πέρας as the ideal type to which the particulars approximate. Thus we derive from the Philebus a hint of the paradigmatic character of the idea, which assumes its full prominence in the Timaeus. This part of the theory however cannot be adequately dealt with until we have examined the latter dialogue.

The most important metaphysical results of the Philebus may thus, I conceive, be enumerated: (1) the assertion of universal mind as the efficient cause, and as the source of particular minds, (2) the distinction of the formal and material element in things, (3) the theory of matter as such, rudimentary as it is, which is given us in the ἀπειρων.

§ 24. Besides this, the Philebus enables us to make another very important deduction from the number of ideas. We now regard the particular as resembling the idea in virtue of its information by the πέρας ἔχον. And in so far as this information is complete the particular is a satisfactory copy of the idea. Now let us represent any class of particulars or μυκτὰ by the area of a circle. The centre of this circle would be marked by the particular, if such could be found, which is a perfect material copy of the idea—that particular in which the formal and material elements are blended in exactly the right way. Let us suppose the other particulars to be denoted by various points within the circle in every direction at different distances from the centre. Now in so far as the particulars approximate to the centre, they are like the idea, and by virtue of their common resemblance to the idea they resemble each other. Such particulars then as resemble each other because of their common resemblance to the idea are called by the class-name appropriate to the idea. But it is clear that particulars may also resemble each other because of a similar divergence from the idea: we may have a number of them clustering round a point within our circle far remote from the centre and therefore very imperfectly representing the idea. Such particulars have a class-name not derived from the idea, but denoting a similar divergence from the idea. A word denoting
divergence from the idea denotes evil. Therefore there are class-names of evil things; but such class-names do not presuppose a corresponding idea: they simply indicate that the particulars comprehended by them fall short of the idea in a similar manner.

For example: a human being who should exactly represent the αὐτὸ ὁ ἐστὶν ἄθροιστος would be perfectly beautiful and perfectly healthy. But in fact humanity is sometimes afflicted with deformity and sickness: we have accordingly class-names for these evils. But one who is deformed or sick fails, to the extent of his sickness or deformity, in representing the ideal type: these class-names then do not represent an idea but a certain falling-off from the idea. Hence we have no idea of fever, because fever is only a mode of deviation from the type¹; and the same is true of all other imperfections. Thus at one stroke we are rid of all ideas of evil.

§ 25. Let us now pause to consider how far these four dialogues have carried us in the work of reconstruction, and how much awaits accomplishment.

In the first place, the elimination of spurious ideas is fully achieved. The Sophist frees us from ideas of relations, the Philebus from those of evil; while σκέψασθαι are rejected on the strength of Aristotle's testimony, confirmed by the total absence of reference to them in the later dialogues: accordingly we have now ideas corresponding only to classes naturally determined. It seems to me manifest that ideas of qualities must also be banished from the later Platonism; and on this point too we have the negative evidence that they are never mentioned in the later dialogues; but there is no direct statement respecting them.

We have also a clear recognition, especially prominent in the Parmenides, of the indissoluble partnership between One and Many, Rest and Motion, Being and Not-being. The necessity for reconciling these apparent opposites is distinctly laid down, though the conciliation is not yet worked out. The acknowledgement of soul as the one existence, from which all finite souls are derived, and as the one efficient cause is a notable advance, as is also the theory of the Theaetetus concerning the relation between particular souls and material nature. And finally we have the analysis of ὄντα into their formal and material elements, and the still immature conception of matter as a potentiality.

¹ In the Phaedo, on the contrary, we definitely have an idea of fever: see 105 C.
Moreover, putting the *Theaetetus* and *Philebus* together, we obtain a result of peculiar importance. From the latter we learn that finite souls are derived from the universal soul, from the former that material objects are but the perceptions of finite souls. The conclusion is inevitable, since the objects which constitute material nature do not exist outside the percipient souls, and since these percipient souls are part of the universal soul, that material nature herself is a phase of the universal soul, which is thus the sum total of existence. Thus we have the plainest possible indication of the ontological theory which is set forth in the *Timaeus*; though, as usual, Plato has not stated this doctrine in so many words, but left us to draw the only possible inference from his language.

§ 26. Yet great as is the progress that has been made, even more remains to be achieved; and it is to the *Timaeus* that we must look for fulfilment.

Although the fundamental problem of the One and the Many is now fairly faced, the solution is not yet worked out. Nor is the relation between the universal efficient Intelligence and the world of matter clearly established: the failure of Anaxagoras in this regard remains still unremedied. Also (what is the same thing viewed in another way) the relation between ideas and particulars is left undefined. Nay, in this respect we seem yet worse off than we were in the *Republic*. For the old unification, such as it was, has disappeared, and no new one has taken its place. Formerly we were content to say that the particulars participated in the ideas, and from the ideas derived their existence. But now this consolation is denied us. We have the ideas entirely separate from the particulars, as types fixed in nature; and no explanation is offered as to how material nature came to exist, or seem to exist, over against them. We have the ‘subjective idealism’ of the *Theaetetus*, and that is all. In fact, while we vindicate the idea as a unity, we seem to sacrifice it as a cause.

Furthermore we desiderate a clearer account of the relation between the supreme idea and the inferior ideas, and also between limited intelligences and the infinite intelligence: nor can we be satisfied without a much more thorough investigation into the nature of materiality. And the answers to all these questions must be capable of being duly subordinated to one comprehensive system.

Now if the *Timaeus* supplies in any reasonable degree a solution
of the aforesaid problems, it seems to me that no more need be said about the importance of the dialogue.

§ 27. In the Timaeus Plato has given us his ontological scheme in the form of a highly mystical allegory. I propose in the first place to give a general statement of what I conceive to be the metaphysical interpretation of this allegory, reserving various special points for after consideration. The ontological teaching of this dialogue, though abounding in special difficulties, can in my belief be very clearly apprehended, if we but view it in the light afforded us by the other writings of this period; on which in turn it sheds an equal illumination.

In the Timaeus then the universe is conceived as the self-evolution of absolute thought. There is no more a distinction between mind and matter, for all is mind. All that exists is the self-moving differentiation of the one absolute thought, which is the same as the Idea of the Good. For the Idea of the Good is Being, and the source of it; and from the Sophist we have learnt that Being is Mind. And from the Parmenides we have learnt that Being which is truly existent must be existent in two modes: it must be one and it must be many. For since One has meaning only when contrasted with Many, Being, forasmuch as it is One, demands that Many shall be also. But since Being alone exists, Being must itself be that Many. Again, Being is the same with itself; but Same has no meaning except as correlated with Other; so Being must also be Other. Once more, Being is at rest; Rest requires its opposite, Motion; therefore Being is also in motion. Seeing then that Being is All, it is both one and many, both same and other, both at rest and in motion: it is the synthesis of every antithesis. The material universe is Nature manifesting herself in the form of Other: it is the one changeless thought in the form of mutable multitude. Thus does dualism vanish in the final identification of thought and its object: subject and object are but different sides of the same thing. Thought must think: and since Thought alone exists, it can but think itself.

1 Considering that the exposition here offered deals with matters of much controversy, my statement may be thought unduly categorical and dogmatic. In reply I would urge that difficulties of interpretation and the manner in which Plato's meaning comes out are pretty copiously discussed in the commentary. At present I am aiming at making my story as clear as possible, to which end I have given results rather than processes. What I conceive to be the justification for the views advanced will, I hope, appear in the course of my exposition.

2 It is easy to see that Aristotle's
INTRODUCTION.

Yet, though matter is thus resolved into a mode of spirit, it is not therefore negated. It is no longer contemptuously ignored or dismissed with a metaphor. Matter has its proper place in the order of the universe and a certain reality of its own. Though it has no substantial being, it has a meaning. For Nature, seeing that she is a living soul, evolves herself after a fixed inevitable design, in which all existence, visible and invisible, finds its rightful sphere and has its appointed part to play in the harmony of the universe. But there is more to be said ere we can enter upon the nature of matter.

§ 28. The universal mind, we say, must exist in the form of plurality as well as in the form of unity. How does this come to pass? The hint for our guidance is to be found in the Philebus, where we learn that, as the elements which compose our bodies are fragments of the elements which compose the universe, so our souls are fragments, as it were, of the universal soul. Hence we see how the one universal intelligence exists in the mode of plurality: it differentiates itself into a number of finite intelligences, and so, without ceasing to be one, becomes many. These limited personalities are of diverse orders, ranging through all degrees of intellectual and conscious life; those that are nearest the absolute mind, if I may use the phrase, possessing the purest intelligence, which fades into deeper and deeper obscurity in the ranks that are more remote. First stands the intelligence of gods, which enjoys in the highest degree the power of pure unfettered thought; next comes the human race, possessing an inferior but still potent faculty of reason. Then as we go down the scale of animate beings, we see limitation fast closing in upon them—intelligence grows ever feebler and sensation ever in proportion stronger, until, passing beyond the forms in which sensation appears to reign alone, we come in the lowest organisms of animal and vegetable life to beings wherein sensation itself seems to have sunk to some dormant state below the level of consciousness. Yet all these forms of life, from the triumphant intellect of a god to the green scum that gathers on a stagnant pool, are modes of one universal all-pervading Life. Reason may degenerate to sensation, sensation to a mere faculty of growth;

\textit{vó̂nos vó̂sos} is directly derived from the Timaeus: though his very fragmentary utterances on this subject leave us in doubt how far he had proceeded on Plato's lines in conceiving of material nature as one mode of the eternal thought.
but all living things are manifestations of the one intelligence expanding in ever remoter circles through the breadth and depth of the universe: each one is a finite mode of the infinite—a mould, so to speak, in which the omnipresent vital essence is for ever shaping itself.

§ 29. So far as the theory has yet taken us, we have on the one hand the universal soul, on the other finite existences into which the universal evolves itself. Matter has not yet made its appearance in our system. But Plato is not wanting in an account of matter; and here the theory of perception in the *Theaetetus* will come to our aid.

In the pluralisation of universal soul finite souls attain to a separate and independent consciousness. But for this independent consciousness every soul has to pay a fixed price. The price is limitation, and the condition of limitation is subjection to the laws of what we know as time and space. But the degree of subjection varies in different orders of existence; and in the higher forms is tempered with no mean heritage of freedom. The object of cognition for finite souls is truth as it is in the universal soul. Now intelligences of the higher orders have two modes of apprehending this universal truth—one direct, by means of the reason, one symbolical, by means of the senses. And when we speak of soul acting by the reason and through the senses, we mean by these phrases that in the one case the soul is exercising the proper activity of her own nature, *qua* soul; in the other that she is acting under the conditions of her limitation, *qua* finite soul: which conditions we saw were time and space. Now the direct apprehension, which we call reasoning, exists to any considerable degree only in gods and in the human race. In the inferior forms of animation the direct mode grows ever feeblener, until, so far as we can tell, it disappears altogether, leaving the symbolical mode of sensuous perception alone remaining. Time and space then are the peculiar adjuncts of particular existence, and material objects, i.e. sensuous perceptions, are phenomena of time and space—in other words symbolical apprehensions of universal truth under the form of time and space. Thus the material universe is, as it were, a luminous symbol-embroidered veil which hangs for ever between finite existences and the Infinite, as a consequence of the evolution of one out of the other. And none but the highest of finite intelligences may lift a corner of this veil and behold aught that is behind it.
INTRODUCTION.

But we must beware of fancying that this material nature has any independent existence of its own, apart from the percipient—it has none¹. All our perceptions exist in our own minds and nowhere else; the only existence outside particular souls is the universal soul. Material nature is but the refraction of the single existent unity through the medium of finite intelligences: each separate soul is, as it were, a prism by which the white light of pure being is broken up into a many-coloured spectacle of ever-changing hues. Matter is mind viewed indirectly. Yet this does not mean the negation of matter: matter has a true reality in our perceptions; for these perceptions are real, though indirect, apprehensions of the universal. And since universal Nature evolves herself according to some fixed law and order, there is a certain stability about our perceptions, and a general agreement between the perceptions of beings belonging to the same rank. But none the less are we bound to affirm that matter has no separate existence outside the percipient soul. Such objectivity as it possesses amounts to this: it is the same eternal essence which is thus symbolically apprehended by all finite intelligences. Mind is the universe, and beside Mind is there nothing.

§ 30. But all this time what has become of the ideas? So far they have not even been mentioned in our exposition. Yet their existence is most strenuously upheld in this dialogue, and therefore their place in the theory must be determined. Our duty then plainly is to search the ontology of the Timaeus for the ideas.

It is notable that in the Timaeus we hear less than usual of the plurality of ideas; nor is that surprising, when so much stress is laid upon a comparatively neglected principle, the unity of the Idea. But the plurality of ideas is not only reaffirmed in the most explicit language, it is a metaphysical principle especially characteristic of the dialogue. The paradigmatic aspect of the ideas now comes into marked prominence: they are the eternal

¹ The teaching of the Theaetetus, viewed in relation with the space-theory of the Timaeus, seems to me perfectly conclusive on this point. It may indeed be argued that only the ἀλθηρός is purely subjective, according to the theory of the Theaetetus; the object generating the ἀλθηρίσμι, although existing in correlation with the subject, has an existence external to it. But this is no real objection. For if Soul is the sum-total of existence, all that exists independently of finite soul is the universal soul. Therefore, so far as the object exists outside the subject, that object is the universal soul itself: that is, as said above, our sense-perceptions are perceptions of the universal under the condition of space.
and immaterial types on which all that is material is modelled. ‘Alles Vergängliche ist nur ein Gleichniss’ might be adopted as the motto of the *Timaeus*.

In order to make clear the position of the ideas in Plato’s maturest ontology, I fear I must to some extent repeat what has been said in the preceding section. The supreme idea, *αὑτὸ ἀγαθὸν*, we have identified with universal *νοῦς*, for which *τὸ ὑπ’, τὸ ἐν*, and *τὸ πᾶν* are synonyms. This universal thought then realises itself by pluralisation in the form of finite intelligences. These intelligences possess a certain mode of apprehending the universal, which we term sensuous perception. By means of such perception true Being cannot be apprehended as it is in itself; what is apprehended is a multitude of symbols which shadow forth the reality of existence, and which constitute the only mode in which such existence can present itself to the senses. These symbols or likenesses we call material objects, which come to be in space, and processes, which take place in time. They have no substantial existence, but are subjective affections of particular intelligences: what is true in them is not the representation in space and time, but the reality of existence which they symbolise. But these symbols do not arise at random nor assume arbitrary forms. Since the evolution of absolute thought is not arbitrary, but follows the necessary and immutable law of its own nature, it may be inferred that all finite intelligences of the same rank have, within a certain margin, similar perceptions. Now the unity of Being presents itself to diverse kinds of sense and to each sense in manifold wise. Each of these presentations is the εἰκών, or image, of which that unity is the παράδειγμα, or original; and the accuracy of the image varies according to the clearness of the presentation. A perfectly clear presentation is a perfect symbol of the truth, the εἰκών exactly reflects the παράδειγμα: a dimmer presentation is a more imperfect image. The παράδειγμα then is the perfect type, to which every particular more or less approximates. Now were this approximation quite successfully accomplished, in every class the particulars, since they all exactly reflected the type, would be all exactly alike. Deviations from the type and consequent dissimilarities among the particulars are due to the imperfect degree in which our senses are capable of apprehending, even in this indirect way, the eternal type.

Since then we see that different classes of material phenomena are so many different forms in which the eternal unity presents
INTRODUCTION.

itself to the senses, it follows that the types or ideas corresponding to such classes are simply determinations of the universal essence or ἀνέπαφον itself: that is to say, each idea is the idea of the good specialised in some particular mode or form—blueness is the mode in which the good reveals itself to the faculty which perceives blue. So then everything in nature which we hear or see or perceive by any perception means the idea of the good. There is thus nothing partial or fractional in Nature: she reveals herself to us one and entire in each of her manifestations. Diversity is of us. We are all beholding the same truth with a variety of organs: it is as though we looked at a flame through a many-faceted crystal, which repeats it on every surface. And since the unity is eternal and inexhaustible, inexhaustible is the number of forms in which it may present itself to every sense.

§ 31. Furthermore, if it were in the nature of finite intelligences to receive through the senses accurate symbols of the good, all things must be perfectly fair; foulness is due to defect of presentation. Hence there can be no ideas of ugliness and dirt, of injustice and evil: all these things arise from failure in representing the idea and consequent failure in existence. For in all things that exist there must be a certain degree of good, else they could not exist at all: even in visible objects that are most hideous there is some fairness; the likeness to the type is there, however marred and scarce discernible. Evil is nothing positive, it is but defect of existence; and this defect is due to the limitations of finite intelligence and of finite modes of being.

To sum up: the one universal Thought evolves itself into a multitude of finite intelligences, which are so constituted as to apprehend not only by pure reason, but also by what we call the senses, with all their attendant subjective phenomena of time and space. These sensible phenomena group themselves into a multitude of kinds, each kind representing or symbolising the universal Thought in some determinate aspect. It is the Universal itself which in each of these aspects constitutes an idea or type, immaterial and eternal, whereof phenomena are the material and temporal representations: the phenomena do in fact more or less faithfully express the timeless and spaceless in terms of space and time. Thus the ἀνέπαφον is the ideas, and the ideas are the phenomena, which are merely a mode of their manifestation to finite intelligence. The whole universe, then, ideal and material,

P. T.
is seen to be a single Unity manifesting itself in diversity. Such I conceive to be the theory of ideas in its final form.

§ 32. One thing more should be added. It is plain from what has been said, that the plurality of ideas is the inevitable consequence of the pluralisation of absolute thought into finite minds. For the various classes of phenomena, to which we need corresponding ideas, are part of our consciousness as limited beings, and arise from our limitation. It is because universal Being is presented to us in this sensuous manner, in groups of material phenomena, that universal Being must determine itself into types of such phenomena. If we were not constituted so as to see roses, there would be no idea of roses. We should then be contemplating the eternal unity directly, as it is in itself: differentiation would neither be necessary nor possible. But this may not be, for pluralisation without limitation is inconceivable: and limitation to us involves space and time. Therefore—paradoxical, nay profane as the statement would have appeared in the days of the Republic—ideas can no more exist without particulars than particulars can exist without the ideas.

§ 33. Before we leave this subject, a question suggests itself to which it is perhaps impossible to return a decisive answer. We have seen that in the mature Platonism ideas are restricted to classes which are naturally determined. Ought we to go a step further and confine the ideas to classes of living things? It appears to me that there are good grounds for an affirmative answer; but Plato has left his intention uncertain.

All the ideas mentioned in the Timaeus, with the exception of one passage, are ideas of ζωα—a term which includes plants as well as animals. The exceptional passage is 51 B, where we hear of πιρ αφο ζΦ άυρου and, by implication, of ideas of the other three elements also. Now that ideas should be confined to ζωα seems reasonable on the following grounds. The supreme idea is expressed in the Timaeus as αφο δ ζωα των, and this includes all other ideas that exist. If then the supreme universal idea is ζωαν, it would seem that the more special ideas, which are subordinate to it, ought to be ζωα likewise. Or let us put it in another way. We have been led to identify the supreme intelligence with the αφο αγαθων. We have said too that this supreme intelligence or idea pluralises itself into finite existences, and that it determines itself into special ideas. Now do not this
pluralisation and this determination constitute one act? Is not the evolution of Mind in the form of human minds the same process as the determination of the idea of Man? If this be so, then, since Mind can only pluralise itself in the form of living beings, it can only determine itself into ideas of ζωā. Aristotle¹ indeed seems to account πυρ, σάρξ, κεφάλη, as natural classes whereof there are ideas: but I very much doubt whether Plato would have admitted ideas of these. The idea of Star involves in its material representation πυρ, even as the idea of Man involves in its material representation σάρξ and κεφάλη: but it in no way requires the existence of any ideas of these things.

There is however the passage 51 b, in which an idea of fire is distinctly mentioned. I think it probable that this passage ought not to be pressed too hard. After he has been speaking of the four material elements, Plato raises the question whether these material substances alone are existent, or whether there is such a thing as immaterial essence: and the four elements being in possession of the stage, it naturally occurs to contrast them with ideal types of the elements. I do not think we are forced to conclude from this that Plato deliberately meant to postulate such ideas. If this explanation be not admitted, I should say that we have in this passage a relic of the older theory, which Plato ought to have eliminated, and would have eliminated, had his attention been drawn to the subject. Practically then I believe that we should regard the ideal world as confined to ideas of ζωā.

§ 34. The foregoing account of the metaphysical teaching contained in the Timaeus suffices, I think, to show that in this dialogue, taken in conjunction with the other later writings, Plato does offer us a solution of the problems enumerated in § 26 as yet unsolved. We now have his theory (1) as to the relation of the efficient mind to material nature, the latter arising from the pluralisation of the former; (2) the relation of the supreme idea to the other ideas, which are determinations of it; (3) the relation of ideas and particulars—that the particular is the symbolical presentation of the idea to limited intelligence under the conditions of space and time; (4) the relation between the supreme intelligence and the finite intelligences, into which it differentiates itself; (5) the relation between the finite intelligence and material nature, involving an account of matter itself;

¹ Metaphysics Λ iii 1070a 19.
and (6) we have the fundamental antithesis of One and Many treated with satisfying completeness. Plato is indeed far more profoundly Herakleitean than Herakleitos himself. Not content, like the elder philosopher, with recognising the antithesis of ὄν and μὴ ὄν as manifested in the world of matter, he shows that this is but the visible symbol of the same antithesis existing in the immaterial realm. True Being itself is One and Many, is Same and Other. Were there not a sense in which we could say that Being is not, there were no sense in which we could say that it verily is. Matter in its mobility, as in all besides, is a likeness of the eternal and changeless type.

It now remains to deal with some special features of the dialogue, and to discuss certain objections and difficulties which may seem to us to threaten our interpretation.

§ 35. The form which Plato gives to his thoughts in this dialogue has greatly multiplied labour to his interpreters. For all his clearness of thought and lucidity of style Plato is always the most difficult of authors: and in the Timaeus we have the added difficulty of an allegorical strain pervading the whole exposition of an ontological theory in itself sufficiently abstruse. And if we would rightly comprehend the doctrine, we must of course interpret the allegory aright. Plato is the most imaginative writer produced by the most imaginative of nations; and he insists on a certain share of imagination in those who would understand him. A blind faithfulness to the letter in this dialogue would lead to a most woful perversion of the spirit. Here, more than in any of Plato's other writings, the conceptions of his reason are instantly decked in the most vivid colours by his poetic fancy. And of all poetical devices none is dearer to Plato than personification. Hence it is that he represents processes of pure thought, which are out of all relation to time and space, as histories or legends, as a series of events succeeding one another in time. In conceiving the laws and relations of mind and matter, the whole thing rises up before his imagination as a grand spectacle, a procession of mighty events passing one by one before him. First he sees the unity of absolute thought, personified as a wise and beneficent creator, compounding after some mysterious law the soul that shall inform this nascent universe: next he describes a doubtful and dreamlike shadow, formless and void, which under the creator's influence, gradually shapes itself into visible existence and is interfused with the world-soul which controls
and orders it, wherewith it forms a harmonious whole, a perfect sphere, a rational divine and everlasting being. Next within this universe arise other divine beings, shining with fire and in their appointed orbits circling, which measure the flight of time and make light in the world. Finally, the creator commits to these gods, who are the work of his hands, the creation of all living things that are mortal: for whom they frame material bodies and quicken them with the immortal essence which they receive from the creator.

All this is pure poetry, on which Plato has lavished all the richness of imagery and splendour of language at his command. But beneath the veil of poetry lies a depth of philosophical meaning which we must do what in us lies to bring to light. And there is not a single detail in the allegory which it will be safe to neglect. For Plato has his imagination, even at its wildest flight, perfectly under control: the dithyrambs of the *Timaeus* are as severely logical as the plain prose of the *Parmenides*.

Most of the details of this myth are considered in the notes as they arise; but there are one or two of its chief features which must be examined here.

§ 36. The central figure in what may be called Plato's cosmological epic is the δημιουργός, or Artificer of the universe. It is evidently of the first importance to determine whether Plato intends this part of his story to be taken literally; and if not, how his language is to be interpreted.

The opinions which have been propounded on this subject may fairly be arranged under three heads.

According to the first view the δημιουργός is a personal God, external to the universe and actually prior to the ideas: to this appertains one form of the opinion that the ideas are 'the thoughts of God.'

There is but one passage in all Plato's works which can give the slightest apparent colour to the theory that the ideas are in any sense created or caused by God. This is in *Republic* 597 B—D, where God is described as the φύτουργός of the ideal bed. But a little examination will show that no stress can really be laid upon this. For to the three beds, the ideal, the particular, and the painted, Plato has to assign three makers. For the two latter we have the carpenter and the artist: then, if the series is to be completed, who could possibly be named as the creator
of the ideal bed save God? And the series must needs be completed to attain Plato's immediate purpose, in order that the carpenter and the artist may be placed in their proper order of merit. The postulation of God as the creator of the ideal bed is merely an expedient designed to serve a temporary end, not a principle of the Platonic philosophy. If we take any other view we bring the passage into direct conflict with the statement beginning 508 e, where it is declared in the plainest language that the Idea of the Good is the cause of all existence whatsoever. Moreover to maintain that the ideas are the thoughts of a personal God is utterly to ignore Plato's emphatic and constantly iterated affirmation of the self-existent substantiality of the ideas. Even could these declarations be explained away, we should have to face Aristotle's criticism of the ideal theory—nay, Plato's own criticism in the Parmenides; neither of which would have any meaning were not the ideas independent essences: the argument of the ἄγνωστος ἁθρωπός, for instance, would be irrelevant. The hypothesis then that a personal God is in any sense the cause of the ideas must be dismissed as incompatible with Platonic principles.

§ 37. Secondly, it is held that the δημοσφράγος is a personal creator, external to the universe and to the ideas, on the model of which he fashioned material nature. This view demands the most careful consideration, since it is the literal statement of the Timaeus. But it will prove, I think, to be totally untenable. In the first place it makes Plato offer us, instead of an ontological theory, a theological dogma; it is an evasion, not a solution of the problem. For we are asked to suppose that after constructing an elaborate ontology which is to unfold the secret of nature, Plato suddenly cuts the knot with a hypothesis which has absolutely no connexion with his ontology. Again, however much opinions may differ as to the extent of Plato's success in eliminating dualism, it will hardly be disputed that to do this was his aim. But here we have not merely dualism, but a triad: the ideas, the creator, and matter. All these are distinct and independent, nor is there any evolution of one from another. Can we seriously believe that Plato's speculations ended in this? And there remain yet more cogent considerations. In this story we find the δημοσφράγος represented as creating Ψυχή. But Ψυχή, we know, is eternal. Her creation must then be purely mythical: and if the creation, surely the creator also. Or if not, since Ψυχή and the δημοσφράγος

(2) is he a personal creator, external to the universe and to the ideas?
are alike eternal, are we to suppose that there are two separate and distinct Intelligences—that is, inasmuch as νοῦς exists in ψυχή alone, two ψυχαὶ to all eternity existing? What could be gained by such a reduplication? Moreover, if two such ψυχαὶ exist, there ought to be an idea of them—a serious metaphysical complication. If on the other hand it be maintained that the cosmic soul is an emanation or effluence of the δημιουργὸς, this is practically abandoning the present hypothesis in favour of that which is next to be considered. Finally, if the δημιουργὸς is a personal creator, he is certainly ζῷον, and νοητὸν ζῷον. What then is his relation to the αὐτὸ ὃ ἐστὶ ζῷον? Either he is identical with it or contained in it: in either case the hypothesis falls to the ground. The literal interpretation of Plato's words must therefore be abandoned for the reason that its acceptance would reduce Plato's philosophy to a chaos of wild disorder.

§ 38. Lastly, the δημιουργὸς is identical with the αὐτὸ ἁγαθὸν. This view, properly understood, I conceive to be in a sense correct: but it needs the most careful defining, and, in the form in which it is sometimes propounded, is unsatisfactory. We can only accept it by realising that the αὐτὸ ἁγαθὸν is the infinite intelligence, which is manifested in the visible universe: and we shall approach the question better if we identify the δημιουργὸς, not in the first place with the ἁγαθὸν, but with ψυχή, which comes to the same in the end.

Now the position of the δημιουργὸς in the Timaeus is precisely that of νοῦς βασιλεὺς in the Philebus: see Philebus 26 Ε—28 Ε. Therefore the δημιουργὸς is the universal intelligence from which all finite intelligences are derived. But intelligence or νοῦς is nothing else than ψυχή pure and simple, apart from any conjunction with matter. What then is the relation of pure intelligence to the cosmic soul which informs the universe? Let us turn once more to the Philebus. In 29 Ε—30 Α νοῦς is definitely identified with the cosmic soul; it is the universal ψυχή whereof all visible nature is σῶμα. So then the δημιουργὸς of the Timaeus must be identical with the world-soul. This is so: but the statement is not yet complete. For the δημιουργὸς is pure reason, while the world-soul, being in conjunction with matter, is ψυχή in all her aspects, con-

1 Compare Timaeus 31 Α τὸ γὰρ περὶ ἡλέον πάντα, ὅπωσα νοητὰ ζῴα, μεθ' ἑτερου δευτερον οὐκ ἄν ποτ' εἶπ' πάλιν γὰρ ἄν ἑτερον εἶναι τὸ περὶ ἐκείνῳ δέοι ζῷον, οὔ μέρος ἄν εἶπ' ἐκείνῳ. The argument is the same as in Republic 597 C.
Attaining the element not only of the Same, but of the Other also. In other words the δημιουργός is to the world-soul as the reasoning faculty in the human soul is to the human soul as a whole, including her emotions and desires. But the reasoning faculty is nothing distinct from the human soul; it is only a mode thereof. The δημιουργός then is one aspect of the world-soul: he is the world-soul considered as not yet united to the material universe—or more correctly speaking, since time is out of the question, he is the world-soul regarded as logically distinguishable from the body of the universe. And since the later Platonism has taught us to regard matter as merely an effect of the pluralisation of mind or thought, the δημιουργός is thought considered as not pluralised—absolute thought as it is in its primal unity. As such it is a logical conception only; it has not any real existence as yet, but must exist by self-evolution and consequent self-realisation. These two notions, thought in unity and thought in plurality, are mythically represented in the Timaeus, the first by the figure of the creator, the second by the figure of the creation: but the creator and the creation are one and the same, and their self-conscious unity in the living κόσμος is the reality of both.

§ 39. Now we may apply what has been said to the αὐτὸ ἄγαθόν. In § 27 we identified the αὐτὸ ἄγαθόν with absolute thought or universal spirit. The identity of νοῦς with the ἄγαθόν is plainly affirmed in Philebus 22 c: compare too the language used of νοῦς in Philebus 26 E with that used of the ἄγαθόν in Republic 508 E. We are justified then in identifying the δημιουργός with the αὐτὸ ἄγαθόν, so long as the ἄγαθόν is conceived as not yet realised by pluralisation. For the realisation of the Good or of Thought comes to pass by the evolution of the One into the Many and the unification of both as a conscious whole. Thus Plato’s system is distinctly a form of pantheism: any attempt to separate therein the creator from the creation, except logically, must end in confusion and contradiction.

§ 40. Thus we see that the process which is symbolised in the creation of the universe by the Artificer is no mere arbitrary exercise of power: it is the fulfilment of an inflexible law. The creator does not exist but in creating: or, to drop the metaphor, absolute thought does not really exist unless it is an object to

1 I must guard against being supposed to mean that the pluralised thought is more real than the primal unity: only that the existence of both is essential to the reality of either.
INTRODUCTION.

itself. So then the creator in creating the world creates himself, he is working out his own being. Considered as not creating he has neither existence nor concrete meaning. Thus we have not far to seek for the motive of creation: it is so, because it must be so. A creator who does not create is thought which does not think, being which does not exist: it is no more than the lifeless abstraction of Eleatic unity.

After what has been said, it is almost a truism to affirm that the process represented in the Timaeus is not to be conceived as occupying time or as having anything whatsoever to do with time. Yet so potent is the spell of Plato’s ποιητής μαχανά, that it may not be amiss to insist upon this once more. The whole story is but a symbolisation of the eternal process of thought, which is and does not become. All succession belongs to the phenomena of thought pluralised; it is part of the apparatus pertaining to them: but with the process of thought itself time has no more to do than space. It seems therefore vain to discuss, as has often been done, the eternity of the material universe in Plato’s system. Considered as one element in the evolution of thought, material nature is of course eternal; but its phenomena, considered in themselves, belong to the sphere of Becoming and have no part in eternity: although, viewed in relation to the whole, time itself is a phase of the timeless, or, as Plato calls it, ‘an eternal image of eternity.’

§ 41. Only if we adopt the interpretation of the δημιουργὸς which I have been defending can we understand Plato’s statement in 92 c that the universe is ‘the image of its maker’—for the reading ποιητῆς is better authenticated than νοητῆς. If the κόσμος is the image of its maker, the maker must be identical with the αὐτὸ δέ ἐστι ζευς. Now since the κόσμος is πᾶν, the ζεῦς cannot be anything outside it: rather it must be the notion which is realised in the universe; a type not separate from the copy, but fulfilled in the copy and in that fulfilment existing. It must be the unity whereof the κόσμος is the expression in multiplicity. Unity is the type, multiplicity the image thereof: and it is necessary that unity, if it is really to exist, must appear also in the form of multiplicity. Thus then must it be with the ζεῦς. But this is exactly the position we have seen reason for assigning to the δημιουργὸς, so that Plato is fully justified in identifying the two. So if we say that the universe is the likeness of its creator, we mean that it is unity manifested in plurality and so realised.

The process symbolised in the Timaeus independent of time and space.

The universe as the likeness of its creator.
The type and the likeness are the same thing viewed on different sides.

It is perhaps worth noticing that our view harmonises with Plato's statement in Parmenides 134c, that as absolute knowledge cannot belong to man, so the knowledge of finite things cannot appertain to God. But if God be distinct from the universe, and so far limited, there seems no reason why he should not have knowledge of finite things. A God who is not the All, however much his knowledge may transcend human knowledge, would surely have the same kind of knowledge. But a God whose knowledge is of the absolute alone is a God whose knowledge is of himself alone; and such a God must be the universe, not a deity external to the universe.

§ 42. Having thus investigated the relation of the δημοκρατία to the cosmic soul and to the material universe, it behoves us to make a similar inquiry concerning the relation of the κόσμος and the ψυχή τοῦ κόσμου. The ψυχογονία of the Timaeus has been treated with some fulness in the commentary, so that a comparatively brief statement may here suffice by way of supplement.

The cosmic soul, like finite souls, consists of three elements—οἱ ταύτων, θάτερον, and οὐσία: that is to say, the principle of Same, i.e. of unity and rest, of Other, i.e. of variety and motion, of Essence, which signifies the identification of these two in one conscious intelligence. The terms ταύτων θάτερον and οὐσία have distinct applications, according to the side from which we regard the subject: these applications I have endeavoured to distinguish in the note on the passage which deals with the question. Let us first look at it thus. The world-soul consists (1) of absolute undifferentiated thought, (2) of this thought differentiated into a multitude of finite existences, and (3) it unites these two elements in a single consciousness. Now of what consists the material part, the body of the κόσμος? Simply of the perceptions of finite consciousnesses. And as these perceptions exist only in the consciousness of the percipient souls, so these souls are comprehended in the universal soul, whereof we have seen that finite souls are, as it were, fractional parts. Therefore the cosmic soul comprehends within her own nature all that exists, whether spiritual or material. Thus the only reality of the universe is the soul thereof, which is the one totality of existence. Matter is nothing but the revelation to finite consciousness, in the innumerable modes of its apprehension, of the universal spirit. All that is material is the expression
in terms of the visible of the invisible, in terms of space and time of the spaceless and timeless, in terms of Becoming of Being. All sensible Nature is a symbol of the intelligible, and she is what she symbolises. So are all things at last resolved into an ultimate unity, which yet contains within itself all possible multiplicity; and Plato's philosophy, shaking off the last remnants of duality, reaches its final culmination in an absolute idealism.

§ 43. But is the cosmic soul herself percipient of matter, or is such perception confined to limited intelligences? I think the true answer is that the cosmic soul is percipient of matter through the finite souls into which she evolves herself. We may regard her elements, ταύτων, θάτερον, οὐσία, either as modes of her existence or as modes of her activity. As a mode of her existence, θάτερον signifies the multitude of finite souls in which she is pluralised. As a mode of her activity, θάτερον is sensible perception. But both modes must belong to the same sphere, so that perception of matter must belong to that phase of the universal soul which appears as a number of finite souls. Thus then the aggregate of perceptions experienced by all finite souls constitute the perception of matter in the cosmic soul: there is no such perception by the cosmic soul apart from the perceptions of finite souls. We must observe that in the region which is θάτερον relatively to the ψυχή τοῦ κόσμου, ταύτων and οὐσία reappear relatively to the finite souls which constitute that region. Each separate soul must have ταύτων also, else it would not have οὐσία, it would not substantially exist: and hence the element of θάτερον in the cosmic soul, and by consequence the cosmic soul herself, would be nonexistent. So each finite soul is a complete miniature copy of the great soul. Accordingly in Plato's similitude we find that the Circle of the Other is constructed of soul which is composed both of Same and of Other.

§ 44. There is yet another question, the answer to which is indeed to be inferred from what has been already said, but which ought perhaps to receive explicit treatment: how are the ideas related to the cosmic soul?

Since we have seen our way to identifying the δημοιοφορός both with the αὐτὸ ἀγαθὸν and with one element of the ψυχή τοῦ κόσμου, the simple unity of thought, conceived as still undifferentiated, it follows that whatever relation we have established between the αὐτὸ ἀγαθὸν and the other ideas will hold good as between the

The cosmic soul and material perception.

Relation between the cosmic soul and the ideas.
cosmic soul and the ideas. But perhaps it may serve to render the matter clearer, if we put it in some such way as this.

The ideas, we know, are self-existing, substantial realities. But they can in no wise be essences external to the world-soul, else would the world-soul cease to be All: they must therefore be included in it or identical with it. Now the body of the universe is the material image of the soul thereof: also all material things are images of the ideas. Thus then, being παραδείγματα of the same ἐκόνες, the ideas and the cosmic soul coincide. The ideas, I say—not an idea. For every single idea is the type of one class of material images; the ideal tree is the type of material trees, and of nothing else. The material trees then represent the cosmic soul in so far as that can be expressed in terms of trees—they represent, so to speak, the δενδρότης of it. Accordingly the idea of tree is one determinate aspect of the cosmic soul—that aspect which finds its material expression in a particular tree. And so the sum total of the ideas will be the sum total of the determinations of the cosmic soul—the soul in all her aspects and significations. Also the supreme idea, the αὐτὸ ἀγαθῶν, will be the soul herself as such, considered as not in any way specially determined: the material copy of which is not anything in the universe, but the material universe as a whole, which is fairer, Plato says, than aught that is contained within it.

Thus by following up this line we arrive at a result which precisely tallies with that which we reached when considering the relation between the αὐτὸ ἀγαθῶν and the inferior ideas. And so is the substantial existence of the ideas preserved intact, since each idea is the universal soul in some special determination. So too is the unity of the eternal essence maintained; for all the ideas are the same verity viewed in different aspects. And here, as everywhere in the mature Platonism, do the principles of Unity and Multitude go hand in hand, mutually supporting one another and never to be parted.

§ 45. We have seen that the universal soul is constituted of ταύτων θάτερον and αὐστία, and the general significance of these terms has been discussed. But there is one special application of θάτερον which has not yet occupied our attention. This is Plato’s conception of χώρα, or Space.

Plato’s identification of the material principle in nature with space—that which there is no more masterly piece of analysis in ancient philosophy—has also been very copiously dealt with
in the notes; but it is too important to be entirely passed over in this place.

It has been seen that in the Philebus the analysis of the material element in things was manifestly incomplete. The ἀπειρον was not altogether ἀπαθεῖς, but possessed ἐναριότητες, such as hotter and colder, quicker and slower, which were quantified and defined by the πέρας ᾿χον. But only the quantity or limit is imposed upon the ἀπειρον from without; the quality, though in an undefined form, is still resident in it. Now however, in the Timaeus, all quality and attribute is withdrawn: we have an absolutely formless ὑποδοχή, or substrate, potentially receptive of all quality, but possessing none. So far, this may be identified with Aristotle's πρῶτη ὕλη. But Plato takes a further step, which was not taken by Aristotle: the ὑποδοχή is expressly identified with Space. How is this done?

The ὑποδοχή is absolutely without form and void: no sense can apprehend it. The sensible objects of perception are the εἶδη εἰσώντα καὶ ἐξίωντα—the images thrown off in some mysterious way by the ideas and localised in the ὑποδοχή. All attributes which belong to our perceptions are due to these εἶδη, save one alone, which is extension. The ὑποδοχή, submissive in all besides, is peremptory on this one point—of whatever kind a material object may be, it must be extended. So then, if we abstract from matter all the attributes conferred by the εἰσώντα καὶ ἐξίωντα, we have remaining just a necessity that the objects composing material nature shall be extended. Thus we see θάτερον in another way playing its part as the principle of Difference. For, as Plato says, if the type and the image are to be different, if they are to be two and not one, they must be apart, not inherent one in the other: the copy must exist in something which is not the type, οὐσίας ἀμοστείτων ἀντεχομένη. Hereupon θάτερον steps in and provides that something, to wit, the law of our finite nature which ordains that we shall perceive all objects as extended in space. Space then is the differentiation of the type and its image.

But extension is nothing independently and objectively existing. For all our perceptions of things are within our own souls, which are unextended; and the things exist not but in these perceptions. Extension then exists only subjectively in our minds. All the objectivity it has is as a universal law binding on finite intelligences, that they should all perceive in this way. It is a consequence and condition of our limitation as finite souls.
The significance of \( \theta \acute{a} \tau e \rho o \nu \) as space is thus but a corollary of its significance as pluralisation of mind; since this pluralisation carries with it sensuous perception, which in its turn involves extension as an attribute of its objects. In like manner is time another consequence of this pluralisation: so that we may regard space and time as secondary forms of \( \theta \acute{a} \tau e \rho o \nu \). And so are all the aspects in which we view the element of \( \theta \acute{a} \tau e \rho o \nu \) necessarily contingent upon its primary significance of Being in the form of Other, the principle of Multitude inevitably contained in the principle of Unity.

§ 46. Up to this point I have dwelt exclusively upon the metaphysical significance of the dialogue: this being of course incomparably more important than all the other matters which are contained in it. Nevertheless the larger portion of the work is occupied with physical and physiological theories, with elaborate explanations of the processes of nature and the structure and functions of the human body. This being the case, it would seem advisable to say a few words on this subject also.

It might excite not unreasonable surprise that Plato, so strongly persuaded as he was that of matter there can be no knowledge, has yet devoted so much attention to the physical constitution of nature; more especially as he repeatedly declares that concerning physics he has no certainty to offer us, but at most 'the probable account.' It is perhaps worth while to see if we can discover any motives which may have influenced him.

In the first place it is to be observed that the restriction of ideas to classes of natural objects tended in some degree to raise the importance of physical study. If it is true that of natural phenomena themselves there can be no knowledge, it is yet possible that the investigation of these phenomena may serve to place us in a better position for attaining knowledge (or approximate knowledge) of the ideas, which are the cause and reality of the phenomena. For from the knowledge of effects we may hope to rise to the cognition of causes. If then ideas are of natural classes alone, we may at least gain thus much from the study of nature: we may by the observation of particulars ascertain what classes naturally exist in the material world, and thence infer what ideas exist in the intelligible world. As Plato says in 69 a, we ought to study the \( \acute{a} \nu \gamma k a i \omega \) for the sake of the
INTRODUCTION.

θεῖον: that is to say, we must investigate the laws of matter in the hope that we may more clearly ascertain the laws of spirit. Physical speculation is not an end in itself: at best it is a recreation for the philosopher when wearied by his more serious studies: but considered as a means of attaining metaphysical truth, it is worthy of his earnest attention. For this cause the study of material nature was encouraged in Plato’s school; though Plato would have been scornful enough of the disproportionate importance attached to it by some of his successors. And since he thought it deserving of his scholars’ attention, it was fitting that the master should declare the results of his own scientific speculation.

It must be remembered too how Plato had found fault with Anaxagoras for not introducing τὸ βαλτιστὸν in his physical theories as the final cause. In the physical part of the Timaeus he seeks to make good this defect. He strives to show in detail how the formative intelligence disposed all matter so as to achieve the best result of which its nature was capable; to show that the hypothesis of intelligent design was borne out by facts. He is careful to point out that the physical processes he expounds are but subsidiary causes, subordinate to the main design of Intelligence; for example, after explaining the manner in which vision is produced, he warns us that all this is merely a means to an end: the true cause of vision is the design that we may look upon the luminaries of heaven and thence derive the knowledge of number, which is the avenue to the greatest gift of the gods, philosophy. Now of course on Platonic principles such a teleological account of Nature can have no completeness, unless it be based upon ontology; since everything is good in so far as it represents the αὕτω δ' ἀγαθόν. Plato describes phenomenal existence as materially expressing the truth of intelligible existence; and in so far as this expression is perfectly accomplished, the phenomena are fair and good. So then Plato, from the teleological side seeks to show that the material universe is ordered as to all its details in the best possible way, and demonstrates, from the ontological side, that this is so because all the phenomena of the universe are symbols of the eternal idea of good. Plato’s contention is that there is an exact correspondence between the ideal and phenomenal worlds, that material Nature is not a mere random succession of appearances, but has a meaning and a truth. And if material Nature has this significance, she cannot be unworthy
INTRODUCTION.

of the philosopher's attention; she must be studied that her meaning may be revealed. Viewed in this light, the physical portions of the Timaeus have a genuine bearing on philosophy; and the very minuteness with which Plato has treated the subject proves that he attached no slight importance to it.

The scientific value of these speculations is naturally but small: many of them are however very interesting, both intrinsically, for their ingenuity and scientific insight, and historically, as showing us how a colossal genius, working without any of the materials accumulated by modern science, and without the instruments which it employs, endeavoured to explain to himself the constitution of the material universe in which he lived.

§ 47. From the question that has just been raised, concerning the bearing of physical inquiry upon metaphysical knowledge, naturally arises another question which should not be left altogether unnoticed. What did the Plato of the Timaeus conceive to be the province of human knowledge, and what sort of knowledge did he conceive to be attainable? We have already seen reason to believe, that he had more or less altered his position with regard to this point since the Republic and Phaedo were written. This was to be expected: for, as the Theaetetus showed, ontology must precede epistemology; before we can say definitely what knowledge is, we must find out what there is to know. Therefore, since Plato's ontology has been modified, it may well be that this modification had its effect on his views of knowledge.

The object of knowledge is plainly the same as ever. Only the really existent can be known: and the only real existence is the ideas, and ultimately the άριστος άληθής. Knowledge then, in the truest and fullest sense of the word, signifies only the actual cognition of the supreme idea as it is in itself. Now in the days of the Phaedo and Republic we know that Plato actually aimed at such cognition. However remote the consummation might be, however despondingly the Sokrates of the Phaedo may speak of it, that and that alone was the end of the philosopher's labours—an end regarded as one day attainable by man. But now, both in the Parmenides and in the Timaeus, Plato disclaims such absolute knowledge as lying beyond the sphere of finite intelligence. And he is right. For he who should know the Absolute would ipso facto be the Absolute. Only the All can comprehend the All. And if the supreme idea cannot be absolutely known, neither can
the other ideas. For since every idea is, as has been said, a determination of the supreme idea, a complete knowledge of any one idea would amount to a complete knowledge of every other idea and of the supreme idea itself. From such ambitious dreams we must refrain ourselves. But we are not therefore left beggared of our intellectual heritage. Absolute knowledge of universal truth may be beyond our reach, but an approximation to such knowledge is in our power, an approximation to which no bounds are set. We have said that the supreme idea determines itself into a series of subordinate ideas. The more of these subordinate ideas we contemplate, the more comprehensive will be our conception of the supreme idea: and in proportion as our vision of the subordinate ideas gains in clearness, even so will our conception of the highest advance in truth. For since Truth is one and simple, every mode of truth is an access to the whole. This then is what Plato now holds up as the philosopher's hope—an ever brightening vision of universal truth, attained by industrious study of particular forms of truth. Thus in place of the complete fruition of knowledge, once for all, of which we once dreamed, we have the prospect of a perpetual advance therein. And whatever increment of knowledge we may win, although it is necessarily incomplete, it is real: the ladder has no summit, but we have gained one step above our former place. And there seems certainly nothing discouraging in the reflection that, however much we may succeed in learning, behind all our knowledge there lies something in wait to be known—that though the truth which we know is true, there is always a truth beneath it that is truer still.

Knowledge then is now as ever for Plato to be found in the ideal world: and there alone. Material nature is still to him a realm of mists and shadows, where nothing stable is nor any truth, where we grope doubtfully by the dim light of opinion. But through these mists lies the road to the bright sphere of reason, where abide the ideal archetypes, which are the true objects of our thought, and which have lost none of that lustre that once was chanted in the Phaedrus. There is no recession here: still the immaterial and eternal only can be known. All that is changed is the extension of the word knowledge. We know the ideas but as finite minds may know them; that is, partially, with never perfect yet ever clearer vision: being ourselves incomplete, completeness of knowledge is beyond our
INTRODUCTION.

scope. This restriction of the bounds of human knowledge must needs have presented itself to Plato's mind along with the clear conception of an infinite universal soul which is the sum and substance of all things. For only in the endeavour to grasp the boundlessness of the infinite would he become fully alive to the limitation of the finite.

§ 48. The account I have thought it necessary to give of the philosophical doctrines contained in the Timaeus is now completed. There are indeed divers matters of high importance handled in the dialogue which I have either left unnoticed or dismissed with brief mention. The theory of space propounded in the eighteenth chapter, although its profound originality and importance can hardly be overestimated, has been only partially examined: further treatment being reserved for the commentary on the said chapter, since it involves too much detail to be conveniently included in a general view of the subject such as I have here sought to give. The same will apply to the very interesting ethical disquisition towards the end of the dialogue, and to the psychological theories advanced in the thirty-first and thirty-second chapters.

In the foregoing pages my aim has been to trace the chief currents of earlier Greek speculation to their union in the Platonic philosophy, and to follow the ever widening and deepening stream through the region of Platonism itself, until it is merged in the ocean of idealism into which Plato's thought finally expands. In particular I have sought to follow the history of the fundamental antithesis, the One and the Many, from the lisping utterance of it (as Aristotle would say) by the preplatonic thinkers to its clear enunciation as the central doctrine of the later Platonism. And however imperfectly this object may have been accomplished, I trust I have at least not failed in justifying the affirmation that the Timaeus is second in interest and importance to none of the Platonic writings.

Of course it is not for a moment maintained that all the teaching I have ascribed to this dialogue is to be found fully expanded and explicitly formulated within its limits. To expect this would argue a complete absence of familiarity with Plato's method. Plato never wrote a handbook of his own philosophy,
nor will he do our thinking for us: he loves best to make us construct the edifice for ourselves from the materials with which he supplies us. And this we can only do by careful combination of his statements on the subject in hand, spread, it may be, over several dialogues, and by sober interpretation of his figurative language, availing ourselves at the same time of whatever light we may be able to derive from ancient expositors of Plato, and chiefly from Aristotle. Consequently no theory we may thus form is a matter of mathematical demonstration: if we can find one which combines Plato’s various statements into a systematic whole and reveals a distinct sequence of his thought, all reasonable expectation is satisfied. In evolving the opinions which have in this essay been offered concerning the interpretation of the Timaeus, I have made but two postulates—that Plato does not talk at random, and that he does not contradict himself. To any who reject one or both of these postulates the arguments adduced in the foregoing are of course not addressed, since there is no common ground for arguing. But of those who accept them, whoever has an interpretation to propound which more thoroughly harmonises all the elements of Plato’s thought than I have been able to do, and which more readily and directly arises from his language, ἐκεῖνος οὐκ ἔχεισὶν ὧν ἄλλα φῶς κρατεῖ.

§ 49. It remains to say a few words about the text. In this edition I have rather closely adhered to the text of C. F. Hermann, which on the whole presents most faithfully the readings of the oldest and best manuscript, Codex Parisiensis A. The authority of this ninth century ms. is such that recent editors have frequently accepted its readings in defiance of a consensus among the remainder; an example which I have in general followed. In departing from Hermann I have usually had some manuscript support on which to rely, and sometimes that of A itself: but in a very few cases (about six or seven, I believe, in all) I have introduced emendations, or at least alterations, of my own; none of which are very important. In order that the reader may have no trouble in checking the text here presented to him, I have added brief critical notes in Latin, wherein are recorded the readings of the Paris manuscript (quoted on Bek-
ker's testimony), of C. F. Hermann, of Stallbaum, and of the Zürich edition by Baiter Orelli and Winckelmann, wherever these differed from my own. These authorities are denoted respectively by A, H, S, and Z. The readings of other manuscripts have not been cited. Fortunately the text of the *Timaeus* is for the most part in a fairly satisfactory condition.

There are some small points of orthography in which this edition systematically differs from Hermann's spelling; but I have deemed it superfluous to record these.

TI. Πάντων μὲν ὅποι, καὶ κατὰ δύναμιν γε οὐδὲν ἐκλείψομεν Β
οὐδὲ γὰρ εἰπ ἂν δίκαιον, χθεσθέντας, ὅσ τὸν πρέπον ἔργον μὴ ὁ προθύμος σε τοὺς λοιποὺς ἦμιν ἀνταφεστιάν.

8 εἰ ἡ δὲ εἰναι Α. ἀν εἰνῃ ΣΖ. 9 ἀνταφεστιάν: ἀντεφεστιάν ΑΣΖ.

17 1—19 2, c. i. Sokrates meets by appointment three of the friends to whom he has on the previous day narrated the conversation recorded in the Republic. After the absence of the fourth member of the party has been explained, he proceeds to summarise the social and political theories propounded in that dialogue.

It will be observed that the unusually long introductory passage, extending to 27 C, has its application not to the Timaeus only, but to the whole trilogy, Republic, Timaeus, Critias. The recapitulation of the Republic indicates the precise position of that work in the series; while the myth of Atlantis marks the intimate connexion which Plato intended to exist between the Timaeus and Critias: it is indeed artistically justifiable only in relation to Plato’s projected, not to his accomplished work. It is obvious that when the Republic was written no such trilogy was in contemplation.

The supposed date of the present discussion is two days after the meeting in the house of Kephalos. The latter, as we learn from the beginning of the Republic, took place on the day of the newly established festival of the Thracial deity.
PERSONS OF THE DIALOGUE:
Sokrates, Timaeus, Hermokrates, Kritias.

I. Sokrates. One, two, three—what is become of the fourth, my dear Timaeus, of our yesterday’s guests and our entertainers of to-day?

Timaeus. He has fallen sick, Sokrates: he would not willingly have been missing at this gathering.

Sokrates. Then it is for you and your companions, is it not, to fulfil the part of our absent friend?

Timaeus. Unquestionably; and we will omit nothing that lies in our power. For indeed it would not be fair, seeing how well we were entertained by you yesterday, that the rest of us should not heartily requite you with a fitting return of hospitality.

Bendis, a goddess whom the Athenians seem to have identified with their own Artemis. The festival took place on the 19th or 20th Thargelion (=about 22nd or 23rd May). On the following day Sokrates reports to the four friends what passed at the house of Kephalos; and on the next the present dialogue takes place.

1. εἰς δύο τρεῖς] This very simple opening has given rise to a strange amount of animadversion, as may be seen by any one who struggles through the weary waste of words which Proklos has devoted to its discussion. Quintilian (ix iv 78) attacks it for beginning with part of a hexameter. It is quoted in Athenaeus ix 382 A, where there is a story of a man who made his cooks learn the dialogue by heart and recite it as they brought in the dishes.

2. δαυτυμόνων] i.e. guests at the feast

διοντες: διδόντες A. 14 μιᾶν ἐκάστῳ τέχνῃ: sic ΣΖ e Bekkeri coniectura. ἀφ' ἐκάστου τῷ τέχνῃ A, quae uncis inclusa retinuit H. 16 ἐνδοθεν: ἑνδον ΣΖ.

1. ὃσα υμῖν] This is doubtless the right reading. Sokrates had bargained with his friends, as we may learn from 20 B, that they should supply the sequel to his discourse: and this they had consented to do. Thus in recapitulating his own contribution Sokrates recalls to their minds what is expected of them.

6. περὶ πολυτειας] Sokrates in his summary of the Republic deals with it solely as a political treatise, totally ignoring its metaphysical bearings. This, while very significant of the change in Plato's views, is due to the fact that it is only on its political side that the Republic is connected with the rest of the trilogy. Its metaphysical teaching is superseded by the more advanced ontology of the Timaeus; and were the dialogue actually incorporated in a trilogy, it would stand in need of sundry important modifications. But the ideal commonwealth is maintained intact: the laws of the καλλιταδις are agreeable to the ontological and physical principles set forth in the Timaeus and find their counterpart in the institutions of ancient Athens as they are to be depicted in the Critias. Now it seems to me highly important to notice that the political theories of the Republic are thus stamped with Plato's deliberate approval in a work belonging to the ripest maturity of his thought—μᾶλα γε ἕμων ῥήθεισα πάσι κατὰ νοῦν. We ought
Sokrates. Do you remember the extent and scope of the subjects I appointed for your discussion?

Timaeus. In part we remember; and whatever we have forgotten, you are here to aid our memory. But I should prefer, if it is not troublesome, that you should briefly recapitulate them from beginning to end, that they may be more firmly fixed in our minds.

Sokrates. I will. The main subject of my discourse yesterday was a political constitution, and the kind of principles and citizens which seemed to me likely to render it most perfect.

Timaeus. Yes, and what you said, Sokrates, was very much to the satisfaction of us all.

Sokrates. Was not our first step to separate the agricultural class and tradesmen in general from those who were to be the defenders of our state?

Timaeus. It was.

Sokrates. And in assigning on natural principles but one single pursuit or craft which was suited to each citizen severally, we declared that those whose duty it was to fight on behalf of the community must be guardians only of the city, in case any one whether without or within her walls should seek to injure her, and that they should give judgment mercifully to their subjects and natural friends, but show themselves stern to the enemies they met in battle.

Timaeus. Quite true.

Sokrates. For we described, I think, a certain temperament which the souls of our guardians must possess, combining in a peculiar degree high spirit and thoughtfulness, that they might

not then to regard the Laios as indicating any abandonment by Plato of his political ideal, but simply as offering a working substitute so long as the attainment of that ideal was impracticable. Plato remains all his life long a true citizen of that city 'whereof the pattern is preserved in heaven'.

7. κατεφαίνειν ἄν] ἄν belongs to γενέσθαι.

rōntos, ēna πρὸς ἐκατέρους δύναντο ὁρθῶς πρᾶοι καὶ χαλεποὶ γλυκεσθαί.

5. [ἐν ἀπασι:] Stallbaum would have τούτων ἀπασι. Plato frequently uses the old form of the dative plural; but there seems no real objection to the preposition.

7. [μῆτε χρυσῶν] Republic 416 D, E.

15. [περὶ γυναικῶν] Plato's regulations for the training of women will be found in Republic 451 C–457 B: he treats of παιδοσύλα in the immediate sequel.

22. [μηχανώμενοι] Hermann's defence of μηχανωμένων is vain; nor is Butt-
be able to show a due measure of mildness or sternness to friend or foe.

Timaeus. Yes.

Sokrates. And what of their training? were they not to have been trained in gymnastic and music and all studies which are connected with these?

Timaeus. Just so.

Sokrates. And those who had undergone this discipline, we said, must not consider that they have any private property in gold or silver or anything else whatsoever, but as auxiliaries drawing from those whom they preserved so much pay in return for their protection as was sufficient for temperate men, they were to spend it in common and pass their lives in company with one another, devoting themselves perpetually to the pursuit of virtue and relieved from all other occupations.

Timaeus. That also is the way it was put.

Sokrates. Moreover with regard to women we observed that their natures must be brought into harmonious similarity with those of men, and that the same employments must be assigned to them all both in war and in their general mode of life.

Timaeus. Yes, that was what we said.

Sokrates. And what were our rules concerning the procreation of children? This, I think, is easy of recollection because of the novelty of our scheme. We ordained that the rights of marriage and of children should be common to all, to the end that no one should ever know his own offspring, but that each should look upon all as his kindred, regarding as sisters and brethren all such as were between suitable limits of age, and those of the former and previous generations as parents and grandparents, and those after them as children and children's children.

Timaeus. Yes, it is very easy to remember this too as you describe it.

Sokrates. Next with a view to securing immediately the utmost possible perfection in their natures, do we not remember that it was incumbent on the rulers of both sexes to make

\[\text{mann's } \mu\eta\chi\alpha\nu\alpha\mu\iota\nu\sigma\nu\ \text{very satisfactory.}\]

\[\text{I agree with Stallbaum in receiving the nominative.}\]

6. ἀδήρες διαδοτέων] Plato has here somewhat mitigated the rigour of his ordinance in the Republic: see 459 D τοὺς ἀριστοὺς ταῖς ἀρισταῖς συγγίνουσαι ὡς πλειότατοι, τοὺς δὲ φαινολογοῦσας ταῖς φαινολογοῖς τοῦντας, καὶ τῶν μὲν τὰ ἐγγόνα τρέφειν, τῶν δὲ μή. Compare too 460 C τὰ δὲ τῶν χειρῶν, καὶ εὰν τὶ τῶν ἄλλων ἀνάπηρον γίγνηται, ἐν ἀπορρήτῳ τε καὶ ἀδήλῳ κατακορύφουσαν ὡς πρέπει: and again, 461 C μᾶλλα μὲν μηδ' εἰς φῶς ἐκφέρειν κίνημα μηδὲ γ' ἐν, εὰν γένηται, εὰν δὲ τι βιάσηται, οὕτω τιθέναι ὡς οὐκ οὕτως τροφῆς τῷ τωτῷ. But in 415 B the milder course is enjoined: εὰν τὰ σφέτερα ἐγγόνα ὑπόχαλκος ὡς ποιήσῃς γένηται, μηδὲν τρόπῳ κατελείψουσαι, ἀλλὰ τῇ τῇ φύσει προσήκουσαν τιμὴν ἀποδοῦσαι θέους εἰς δημούργοις ἢ εἰς γεωργοὺς. Probably then, when Plato speaks of not rearing the inferior children, he merely means that they are not to be reared by the state as infant φύλακες.

7. ἐπαυξανομένων δὲ σκοποῦντας] Plato clearly recognises that the laws of heredity are only imperfectly understood by us, and that therefore the results may often baffle our expectation.
provision for the contraction of marriages by some secret mode of allotment, that to the good and bad separately might be allotted mates of their own kind, and so no ill-feeling should arise among them, supposing as they would that chance governed the allotment?

Timaeus. We remember that.

Sokrates. And the offspring of the good we said must be reared, while that of the bad was to be secretly dispersed among the other classes of the state; and continually observing them as they grew up, the rulers were to restore to their rank such as were worthy, and in the places of those so promoted substitute the unworthy in their own rank.

Timaeus. Quite so.

Sokrates. Have we now said enough for a summary recapitulation of yesterday's discourse? or do we feel that anything is lacking, my dear Timaeus, to our account?

Timaeus. Not at all: you have exactly described what was said, Sokrates.

II. Sokrates. Listen then and I will tell you in the next place what I feel about the constitution which we described. My feeling is something like this: suppose a man, on beholding beautiful creatures, whether the work of the painter or really alive but at rest, should conceive a desire to see them in motion and putting into active exercise the qualities which seemed to belong to their form—this is just what I feel about our city which we described: I would fain listen to one who depicted her engaged in a becoming manner with other countries in those struggles which cities must undergo, and going to war, and when at war showing a result worthy of her training and educa-

19 B—21 A, c. ii. Sokrates now expresses his desire to see his pictured city called as it were into life and action; he would have a representation of her actual doings and dealings with other cities. He distrusts his own power to do this worthily, nor has he any greater confidence in poets or sophists. But he declares that his three companions are of all men the best fitted by genius and training to accomplish it; and he therefore calls on them to gratify his wish. Hermokrates readily assents, but first begs Kritias to narrate a forgotten legend of ancient Athens, which he thinks is apposite to the matter in hand: to this Kritias consents.

17. οἶνον καὶ τοὺς This passage is referred to by Athenaeus XI 507 D in support of the truly remarkable charge of ἀπολογία which he brings against Plato.
Demosthenes ascribed "they" single vote to the laws and express...
tion, both when dealing in action and parlaying in speech with other cities. Now, Kritias and Hermokrates, my own verdict upon myself is that I should never be capable of celebrating the city and her people according to their merit. So far as concerns me indeed, that is no marvel; but I have formed the same opinion about the poets, both past and present; not that I disparage the poetic race, but any one can see that the imitative tribe will most easily and perfectly imitate the surroundings amid which they have been brought up, but that which lies outside the range of each man's experience is hard to imitate correctly in actions and yet harder in words. As to the class of sophists on the other hand, I have always held them to be well furnished with many fine discourses on other subjects; yet I am afraid, seeing they wander from city to city and have never had dwellings of their own to manage, they may somehow fall short in their conception of philosophers and statesmen, as to what in time of war and battles they would do and say in their dealings and converse with divers people. One class then remains, those who share your habit of mind, having by nature and training a capacity for both philosophy and statecraft. Timaeus for instance, belonging to an admirably governed state, the Italian Lokris, and one of the foremost of its citizens in wealth and birth, has filled offices of the highest authority and honour in his native city, and has also in my judgment climbed to the topmost peak of all philosophy: while at Athens we all know that Kritias is no novice in any of the questions we are discussing: of Hermokrates too we must believe on the evidence of

20. ἵπτε ἄριον ἀπάσης] Plato's judgment of the historical Timaeus can hardly have gone so far as this: that however he must have set a high estimate on the Pythagorean's philosophical capacity he has proved by making him the mouth-piece of his own profoundest speculations.

21. οὐδενός ἰδιώτην] ἐκαλεῖ τι ἰδιώτης μὲν ἐν φιλοσόφοις, φιλόσοφος δὲ ἐν ἰδιώταις, says Proklos. He seems to have been one of those who made a good show out of a little knowledge: cf. Char.

22. Ἐρμοκράτους] This was the celebrated Syracusan general and statesman, distinguished in the Peloponnesian war. A Hermokrates mentioned among the friends of Sokrates by Xenophon memorabilia 1 ii 48 is doubtless a different
person: a friendship between Sokrates and the Syracusan leader is in itself improbable, if not impossible, and the language of Sokrates in the present passage seems inconsistent with the existence of any intimacy. That however the Syracusan is the interlocutor in this dialogue seems to me certain. Plato has assembled a company of the very highest distinction, among whom an obscure companion of Sokrates would be out of place.

4. εἰς γὰρ πόλεμον πρέποντα] The prominence given to war throughout the passage is notable: it is considered as a normal mode of a state's activity. And in fact, when Plato wrote, it could hardly be regarded otherwise.

9. κεκοσμημένος] i.e. with festal attire and garland.

11. καὶ μὲν δὴ] This is the only occasion throughout the dialogue on which Hermokrates opens his lips.

24. Δρωπίδου] Proklos makes out the genealogy thus:
many witnesses that his genius and acquirements qualify him to deal with all such matters. This was in my mind yesterday when I willingly complied with your request that I should repeat the conversation concerning the ideal polity; for I knew that no men were more competent than you, if you were willing, to supply the sequel: no one else indeed at the present day could, after engaging our city in an honourable war, render her conduct worthy of her in all respects. So after saying all that was enjoined on me I in my turn enjoined upon you the task of which I now remind you. Accordingly you consulted together and agreed to entertain me at this time with a return 'feast of reason'. I am here then ready for it in festal array, and never was there a more eager guest.

Hermokrates. Indeed, Sokrates, as Timaeus said, there will be no lack of zeal on our part, nor can we attempt to excuse ourselves from performing the task. In fact yesterday immediately on leaving this spot, when we reached the guest-chamber at the house of Kritias where we are staying, and even before that on our way thither, we were discussing this very matter. Kritias then told us a story from an old tradition, which you had better repeat now, Kritias, to Sokrates, that he may help us to judge whether it will answer the purpose for our present task or not.

Kritias. So be it, if our third partner Timaeus agrees.

Timaeus. I quite agree.

Kritias. Listen then, Sokrates, to a tale which, strange though it be, is yet perfectly true, as Solon, the wisest of the seven, once affirmed. He was a relation and dear friend of Dropides, my great-grandfather, as he says himself in many

He must however be mistaken in making Solon and Dropides brothers: Plato's words evidently do not imply so close a relationship. Moreover it would seem that Solon has been placed a generation too near to the elder Kritias.

P. T.
IIAATnNOS

Δὲ Κριτιαν που τὸν ἴμετερον πάππον εἶπεν, ὡς ἀπεμνημόνευν αὐτὸς ἡμᾶς ὁ γέρων, ὅτι μεγάλα καὶ θαυμαστὰ τῇδε εἶχεν παλαιὰ ἔργα τῆς πόλεως ὑπὸ χρόνου καὶ φθορᾶς ἀνθρώπων ἥφαιστον, πάντων δὲ ἐν μέγαστον, οὐ γὰρ ἐπιμηνείσθη πρότερον ἂν ἴμεν εἶχεν οὐ δὲ 21 Α. 5 τε ἀποδοῦναι χάριν καὶ τὴν θεόν ἄμα εἰ τῇ πανηγύρει δικαίως τε καὶ ἀληθῶς οἴόμετε ὑμοῦντας ἐγκωμιάζει.

5. ἐν τῇ πανηγύρει] The goddess is of course Athena; and the festival would seem to be the lesser Panathenaia, as Proklos tells us. Considerable discussion has arisen as to the time of year in which this festival was held. The greater Panathenaia, which took place once in four years, lasted from the 17th to the 25th Hekatombaion. The lesser festival was annual. Demosthenes κατὰ Τιμοκράτους § 26 refers to a Panathenaic festival which took place in Hekatombaion; and it is affirmed by some scholars that he is speaking of the lesser Panathenaia. Were this so, it would follow that the greater and lesser festivals were held at the same time of year. But Proklos has an explicit statement to the contrary: δὴ γε μὲν τὰ Παναθήναια (sc. τὰ μεγάλα) τοῖς Βευδείαῖς ἐλέτο λέγοντοι οὐ ὑπομνημαστατὰ, καὶ Ἀριστερῆς ὁ Γάδιος μαρτυρεῖ τὰ μὲν ἐν Πειραΐα Βευδεία τῇ εὐλαβεῖ τοῦ Θαργηλίων ἐπιτελείσθα, ἐκεῖθεν δὲ τὰς περὶ τῶν Ἀθηνῶν διόρας. It seems to me that this direct evidence is not to be outweighed by an uncertain argument based on the passage of Demosthenes. Clinton Fasti Hellenici 11 pp. 332—5 has a careful discussion of the question and decides in favour of placing the lesser Panathenaia in Thargelion.

7. οὐ λεγόμενον μὲν] Stallbaum is ill advised in adopting the interpretation of Proklos μὴ πάντω μὲν τεθρυλημένων, γενόμενον δὲ ἐμος. The meaning is beyond question 'not a mere figment of the imagination (like the commonwealth described in the Republic), but a history of facts that actually occurred'. Cf. 26 ε ἐ τὸ τὲ μὴ πλασθέντα μῦθον ἀλλ' ἀληθινὸν λόγον εἶπαι πάμμεγα ποι. 21 Α.—25 Δ, c. iii. Kritias proceeds to tell a story which his grandfather once learned from Solon: that when Solon was travelling in Egypt he conversed with a priest at Sais; and beginning to recount to the priest some of the most ancient Hellenic legends he was interrupted by him with the exclamation 'Solon, ye are all children in Hellas, and no truly ancient history is to be found among you. For ever and anon there comes upon the earth a great destruction by fire or by water, and the people perish, and all their records and monuments are swept away. Only in the mountains survive a scattered remnant of shepherds and unlettered men,
passages of his poems: and Dropides told my grandfather Kritias, who when advanced in life repeated it to us, that there were great and marvellous exploits achieved by Athens in days of old, which through lapse of time and the perishing of men have vanished from memory: and the greatest of all is one which it were fitting for us to narrate, and so at once discharge our debt of gratitude to you and worthily and truly extol the goddess in this her festival by a kind of hymn in her honour.

_Sokrates._ A good proposal. But what was this deed which Kritias described on the authority of Solon as actually performed of old by this city, though unrecorded in history?

III. _Kritias._ I will tell an ancient story that I heard from a man no longer young. For Kritias was then, as he said, hard upon ninety years of age, while I was about ten. It happened to be the 'children's day' of the Apaturia; and then as usual the boys enjoyed their customary pastime, our fathers giving us knowing nought of the past: and when again a civilisation has slowly grown up, presently there comes another visitation of fire or water and overwhims it. So that in Greece and most other lands the records only go back to the last great cataclysm. But in Egypt we are preserved from fire by the inundation of the Nile, and from flood because no rain falls in our land: therefore our people has never been destroyed, and our records are far more ancient than in any other country on earth. Then the priest goes on to tell Solon one of these histories: how that nine thousand years ago Athens was founded by Athena, and a thousand years later Sais was founded by the same goddess; how the ancient Athenians excelled all nations in good government and in the arts of war; and above all how they overthrew the power of Atlantis. For Atlantis was a vast island in the ocean, over against the pillars of Herakles, and her people were mighty men of valour and had brought much of Europe and Africa under their sway. And once the kings of Atlantis resolved at one blow to enslave all the countries that were not yet subject to them, and led forth a great host to subdue them. Then Athens put herself at the head of the nations that were fighting for freedom, and after passing through many a deadly peril, she smote the invaders and drove them back to their own country. Soon after there came dreadful earthquakes and floods; and the earth opened and swallowed up all the warriors of Athens; and Atlantis too sank beneath the sea and was never more seen.

13. _Ἀπατούρια_ Apaturia was the name of a festival in honour of Dionysos, held in the month Pyanepisian, which corresponded, roughly speaking, with our October. It lasted three days, of which the first was called ἄναρπεια, the second ἄναρτις, the third κουρεῖς. On this third day the names of children three or four years of age were enrolled on the register of their _φαρτᾶ_ Proklos seems mistaken in making ἄναρτις the first day: all other authorities place ἄναρπεια first.
10. *Διά τάς στάσεις* Plutarch *Solon* c. 31 says it was old age, not civil troubles, which prevented Solon from carrying out his designs.

14. *Δέ...οὐσις* i.e. it would have been, had circumstances been less unfavourable.

21. "Αμασίς ὁ βασιλεὺς" According to Herodotus 11 172 the birthplace of Amasis was not Sais itself, but Siouph, another city in the Saitic nome. From Stallbaun’s note it appears that this reference to Amasis placed in Solon’s mouth has been regarded as an anachronism, and so Stallbaum himself seems to consider it. But since Amasis ascended the Egyptian throne in 569 B.C., according to Clinton, there is no obvious reason why Solon should not mention him, or why he may not even have visited him, as Herodotus affirms, 1 30. For Solon was certainly alive after the usur-
prizes for reciting poetry. A great deal of poetry by various authors was recited, and since that of Solon was new at the time, many of us children sang his poems. So one of the clansmen said, whether he really thought so or whether he wished to please Kritias, he considered that Solon was not only in other respects the wisest of mankind but also the noblest of all poets. The old man—how well I recollect it—was extremely pleased and said smiling, Yes, Amynandros, if he had not treated poetry merely as a by-work, but had made a serious business of it like the rest, and if he had finished the legend which he brought hither from Egypt, instead of being compelled to abandon it by the factions and other troubles which he found here on his return, my belief is that neither Hesiod nor Homer nor any other poet would have enjoyed greater fame than he. What was the legend, Kritias? asked Amynandros. It concerned a mighty achievement, he replied, and one that deserved to be the most famous in the world; a deed which our city actually performed, but owing to time and the destruction of the doers thereof the story has not lasted to our times. Tell us from the beginning, said the other, what was the tale that Solon told, and how and from whom he heard it as true.

There is in Egypt, said Kritias, in the Delta, at the apex of which the stream of the Nile divides, a province called the Saitic; and the chief city of this province is Sais, the birthplace of Amasis the king. The founder of their city is a goddess, whose name in the Egyptian tongue is Neith, and in Greek, as they aver, Athena: the people are great lovers of the Athenians and claim a certain kinship with our countrymen. Now when Solon travelled to this city he said he was most honourably entreated by the citizens; moreover when he questioned concerning ancient things such of the priests as were most versed therein, he found that neither he nor any other Grecian man, one might wellnigh say, knew aught about such matters. And once, when he wished to lead them on to talk of ancient times,
2. Φορωνέως] Phoroneus is said in the legend to have been the son of Inachos: he was nevertheless the first man according to the explanation in Pausanias ΠΑΣΙΝΙΑΝΟΣ: αὐτὸν τόν τῶν ἀρχαίων τῶν νεκρῶν τούτων καὶ Νιόβης, and, met' αὐτῷ τῶν κατακλυσμῶν αὖ περὶ Δευκάλλων καὶ Πύρρας ὅσις διεγένεστο μυθολογεῖν, καὶ τόσο εὖ αὐτῶν γεγεναλογεῖν, καὶ τὰ τῶν ἐτῶν ὡσα ἡν αὐτῶν ἑλειφθείσιν.

5 περισσώθητι διὰ μεμηνοεῖν τοὺς χρόνους ἀριθμεῖν καὶ τίνα οἰκτείνυ τῶν ἱερέων εὐ μᾶλα παλαιῶν θεοῦ Σόλων, Σόλων, Ἔλληνες ἀεὶ παῖδες ἐστε, γερῶν δὲ Ἔλλην οὐκ ἠστιν. ἀκούσας οὖν, Πῶς τί τούτῳ λέγειν; φάναι. Νέοι ἐστὲ, εἰπεῖν, τὰς ψυχὰς πάντες· οὐδεμίαν γὰρ ἐν αὐταῖς ἐχετε δι' ἀρχαῖαν ἀκοῆν παλαιῶν δόξαν οὐδὲ μάθημα χρόνῳ πολὺν οὐδέν. τὸ δὲ τῶν αἵτιον τόδε. πολλὰ καὶ κατὰ πολλὰ φθοράν γεγόνας ἀνθρώπων καὶ ἐσονται πυρὶ μὲν καὶ ὑδατί μεγίσται, μυρίοις δὲ ἄλλοις ἔτερα βραχύτερα. τὸ γὰρ οὖν καὶ παρ' ἤνεν λεγόμενον, ὡς ποτε Παέθων Ἡλίου παῖς τὸ τοῦ πατρὸς ἀρμα ἡξίας διὰ τὸ μὴ δυνατὸς εἶναι κατὰ τὴν τοῦ πατρὸς ὁδὸν ἐλαίαν τὰ τ' ἐπὶ γῆς ἐνικάκασε καὶ αὐτὸσ κεραυνωθεὶς διεθράρη, τούτῳ μύθῳ μὲν σχῆμα ἔχουν λέγεται, τὸ δὲ ἀληθές ἐστὶ τῶν περὶ γῆν καὶ κατ' οὐρανὸν ἱόντων παράλλαξις καὶ διὰ μακρῶν χρόνων θεού γενομένη τῶν ἐπὶ γῆς πυρὶ πολλῷ φθορά. τότε οὖν ὅσοι κατ' ὅρη καὶ ἐν ὑψηλοῖς τόποις καὶ ἐν ἥξιοῖς οἰκοῦσι, μᾶλλον διὸλυνται τῶν ποταμῶν καὶ βαλλάττῃ προσοκούντων· ἠμίς δὲ ὁ Νείλος εἰς τὰ ἄλλα σωτήρ καὶ τότε ἐκ ταύτης τῆς ἀπορίας σφέξει λυόμενος. ὅταν δ' αὐ θεί τήν γῆν ὑδασὶ καθαίροντες κατακλυσμοῖς.
he essayed to tell them of the oldest legends of Hellas, of Phoroneus who was called the first man, and of Niobe; and again he told the tale of Deukalion and Pyrrha, how they survived after the deluge, and he reckoned up their descendants, and tried, by calculating the periods, to count up the number of years that passed during the events he related. Then said one of the priests, a man well stricken in years, O Solon, Solon, ye Greeks are ever children, and old man that is a Grecian is there none. And when Solon heard it, he said, What meanest thou by this? And the priest said, Ye are all young in your souls; for ye have not in them because of old tradition any ancient belief nor knowledge that is hoary with eld. And the reason of it is this: many and manifold are the destructions of mankind that have been and shall be; the greatest are by fire and by water; but besides these there are lesser ones in countless other fashions. For indeed that tale that is also told among you, how that Phaethon, the child of the Sun, yoked his father’s chariot, and for that he could not drive in his father’s path, he burnt up all things upon earth and himself was smitten by a thunderbolt and slain—this story, as it is told, has the fashion of a fable; but the truth of it is a deviation of the bodies that move round the earth in the heavens, whereby comes at long intervals of time a destruction with much fire of the things that are upon earth. Thus do such as dwell on mountains and in high places and in dry perish more widely than they who live beside rivers and by the sea. Now the Nile, which is in all else our preserver, saves us then also from this distress by releasing his founts: but when the gods send a flood upon the earth, cleansing her with regular course of nature.

22. λυόμενος] The explanation given of this word by Proklos is utterly worthless: λυται γὰρ Ἀττικῶς διϊ λυει τῆς ἀπορλας ημᾶς ὁ Νεῖλος. Even conceding the more than doubtful Atticism of λυ-μενος=λύων (the only authority Stallbaum can quote is a very uncertain instance in Xenophon de venatu 1 17), the clumsy tautology of the participle, thus understood, is glaring. It appears to me that the right interpretation has been suggested by Porphyrios, whom Proklos quotes with disapprobation. Πορφύριος μὲν δὴ φησιν, διϊ δέξα ἦν παλαι Ἀλγυπτίων τὸ θόωρ κάτωθεν ἀναβλυστάων τῇ ἀναβάσει τοῦ Νείλου, διϊ καὶ ἱδρῶτα τῆς ἐκάλουν τὸν Νεῖλον, καὶ τὸ ἐπανέναι κάτωθεν ταῦτο τῷ Αἰγυπτίω δηλοῦν καὶ τὸ σῶζειν λυό-μενον, οὔτε διϊ ἡ χιών λυόμενη τῷ πλῆθος τῶν ὀδάων ποιεῖ, ἀλλ’ διϊ λυται ἀπὸ τῶν ἐαυτοῦ πηγῶν καὶ πρόειναι εἰς τὸ ἐμφανὲς ἐπεχώμενος πρότερον. Nothing can be more natural than that the Egyptians should have believed that the ‘earth is full of secret springs’, which by their
Thus cf. p%^9 on but being T& Tore 15 5 Tat9 eVi TraXa\iara. rieWt a/eo)i/ d\r)v fapopevov 7roXet9 /epoi9 a/xouo-oi/9 irpwrov breaking tion. an tevoj Egyptians tira.vifra.1 a of ble leased priest's dation the flagrations, accordingly priest’s the edition of the Nile, from the second by the total absence of rain in their country. Accordingly their population is continuous, and their monuments and other records escape destruction. But in Greece and elsewhere, when a deluge comes, the inhabitants of cities and the low countries are swept into the sea, and only the rude dwellers in the mountains escape: cf. Critias 109 D, Laws 677 B. Thus from time to time the more cultivated portion of the inhabitants, with all their memorials, are cut off, and civilisation has to make a fresh start: on which account all their history is of yesterday compared with that of the Egyptians. It would seem however that a conflagration which should occur in the winter or spring might take Egypt at a disadvantage.

6. τὸ δὲ ἀλήθεια The application of this remark is not very obvious, but I take it to be this. We have seen that the history of the Egyptians, owing to their immunity from φθορά, goes back to an extremely remote period, and consequently many φθορά ἀνθρώπων are recorded. Elsewhere this immunity does
waters, those in the mountains are saved, the shepherds, but the inhabitants of the cities in your land are swept by the rivers into the sea. But in this country neither then nor at any time does water fall from on high upon the fields, but contrariwise all rises up by nature from below. Wherefore and for which causes the legends preserved here are the most ancient that are told: but the truth is that in all places, where exceeding cold or heat does not forbid, there are ever human beings, now more, now fewer. Now whether at Athens or in Egypt, or in any other place whereof we have tidings, anything noble or great or otherwise notable has occurred, we have all written down and preserved from ancient times in our temple here. But with you and other nations the commonwealth has only just been enriched with letters and all else that cities require: and again after the wonted term of years like a recurring sickness comes rushing on them the torrent from heaven; and it leaves only the unlettered and untaught among you, so that as it were ye become young again with a new birth, knowing nought of what happened in the ancient times either in our country or in yours. For instance the genealogies, Solon, which you just now recounted, concerning the people of your country, are little better than children’s tales. For in the first place ye

not exist: tradition tells of but one φθορά; and people suppose that there has been but one, and that the existence of man in their country dates from a comparatively recent time. But the truth is, says the priest, that in all countries where the climate admits of human life there has been a human population of varying extent surviving a number of φθοραί, although no memorial of the earlier inhabitants remains. It was a common belief that as the North from cold, so the South from heat was uninhabitable by man: cf. Aristotle meteorologica II ν 361 b 26 ἐνθα μὲν γὰρ διὰ ψυχὸς οὐκέτι κατοικοῦσιν, ἐνθα δὲ διὰ τὴν ἄλεαν. The difficulty about the sentence is that τὸ δ’ ἀληθὲς has the air of correcting the statement in the preceding clause: whereas what is really corrected is the implied misconception; i.e. that the antiquity of man in other countries is no greater than that of the records.

12. κατεσκευασμένα...γράμμασι] ‘literis mandata’, says Stallbaum, a rendering which will surely find few friends: nor can we confine ἄτασιν ὑπὸ σιω πόλεως ἱεράται to public monuments, as he would have us. κατεσκευασμένα means ‘furnished’ or ‘enriched’, a sense which it bears several times in Thucydides: see vi 91, viii 24. The following words generally comprehend all the appurtenances of civilisation: amongst others, as Proklos says, τέχναι καὶ ἀγοραὶ καὶ λοιπά. τὸ παρ᾽ ὑμῖν is also a general phrase; = your institutions or commonwealths. Compare Critias 110 λ ὅταν ἤλθον τιαν ἡδον τοῦ βιοῦ τάναγκα κατεσκευασμένα.

13. δὲ εὐδότων ἑτῶν] These words show conclusively that the φθοραί were normal and regularly recurrent.

9 ὁπόσον ὑπὸ: ὁπόσον νῦν ὑπὸ ΗΖ.
16 ἐνθάδε: ἐνθάδε S.
22 τίγδε: τίγδε Α.

1. ἐπ’ ἀνθρώπους] ἐπὶ signifies extension over: a use exceedingly rare in Attic prose, but occurring again in Critias 112 E ἐπὶ πᾶσιν έδρότην καὶ Ἀσίαν κατὰ τε σωμάτων κάλλη καὶ κατὰ τὴν τῶν ψυχῶν παντοῖον ἀρετὴν ἐλλόγομα τῇ ἡσαν καὶ ὀνομαστότου πάντων τῶν τότε: and a similar, though not identical, use is to be found in Protagoras 322 D. It is not uncommon in Homer, e.g. Iliad x 213 μέγα κέν οἱ ὑπουράνιον κλέος ἐγ’ | πάντας ἐπ’ ἀνθρώπους.

5. ὑπέρ τὴν μεγίστην φθοράν] ὑπέρ = back beyond.
8. πολιτεία] The plural is somewhat curious: it seems to stand for 'political institutions'.

15. Γῆς τε καὶ Ἡφαίστου] As we shall presently see, earth and fire are the two principal elements of which material nature is composed, air and water being means between them; cf. 31 c foll. Fire is the simplest combination of one of the two primary bases, while earth is the only form of the other, 51 d foll. These were the two ὁρχαί of Parmenides: Arist. metaph. i ν 960b 33 δῶ τὰς αἰτίαις καὶ δῶ τὰς ἀρχαῖς πάλιν τίθοις, θεροῦ καὶ ψυχρῶν, οἶον πῦρ καὶ γῆν λέγων. Cf. physica i ν 188a 20. Plato’s statement falls in with
remember but one deluge, whereas there had been many before it; and moreover ye know not that the fairest and noblest race among mankind lived once in your country, whence ye sprang and all your city which now is, from a very little seed that of old was left over. Ye however know it not, because the survivors lived and died for many generations without utterance in writing. For once upon a time, Solon, far back beyond the greatest destruction by waters, that which is now the city of the Athenians was foremost both in war and in all besides, and her laws were exceedingly righteous above all cities. Her deeds and her government are said to have been the noblest among all under heaven whereof the report has come to our ears. And Solon said that on hearing this he was astonished, and used all urgency in entreatying the priests to relate to him from beginning to end all about those ancient citizens. So the priest said, I grudge thee not, O Solon, and I will tell it for thy sake and for the sake of thy city, and chiefly for the honour of the goddess who was the possessor and nurse and instructress both of your city and of ours; for she founded yours earlier by a thousand years, having taken the seed of you from Earth and Hephaistos; and ours in later time. And the date of our city's foundation is recorded in our sacred writings to be eight thousand years ago. But concerning the citizens of Athens nine thousand years ago I will inform you in brief of their laws and of the noblest of the deeds which they performed: the exact truth concerning everything we will examine in due order hereafter, taking the actual records at our leisure.

Consider now their laws in comparison with those of our country; for you will find here at the present day many examples of the laws which then existed among you:—first the separation of the priestly caste from the rest; next the distinc-

Athenian mythology: Erechtheus was the son of Earth and Hephaistos.

22. παραδείγματα is of course not put for εἰκόνας, as Proklos would have it, but signifies samples, specimens.

23. τὸ τῶν ἱερῶν γένος] Plato's classification does not coincide with that given in Herodotus ii 164. The latter makes seven castes: ἔστι δὲ Αθηναίων ἑπτά γένεα, καὶ τούτων οἱ μὲν ἱερεῖς, οἱ δὲ μάχημοι κεκλεῖται, οἱ δὲ βουκόλαι, οἱ δὲ συβώται, οἱ δὲ κάτηλοι, οἱ δὲ ἔρμηνες, οἱ δὲ κυβερνάται. The discrepancy arises from the fact that there were actually three castes, the two higher being priests and warriors, and the lowest comprising men following various occupations which are differently enumerated by different authorities.
from thence principles of practical use for human needs, applying them to divination and medicine and the other sciences therewith connected. The peculiarity of the law in fact consisted in basing its precepts concerning practical arts such as medicine (ἀνθρώπινα) upon universal truths of nature (θεία). μέχρι μαντικῆς, i.e. bringing its deductions down to divination. In the words ἐκ τοῦτον θείων ὄντων εἰς τὰ ἀνθρώπινα ἀνευρὼν we certainly have a difficulty of construction. I take the meaning to be 'from these divine studies (i.e. of the κόσμος) having invented them (μαντικῇ and λατρίᾳ) for human needs'. But the lack of an object to ἀνευρὼν and the construction of εἰς τὰ ἀνθρώπινα are alike unsatisfactory; and I
tion of the craftsmen, that each kind plies its own craft by itself and minglest not with another; and the class of shepherds and of hunters and of husbandmen are set apart; and that of the warriors too you have surely noticed is here sundere from all the other classes; for on them the law enjoineth to study the art of war and nought else. Furthermore there is the fashion of their arming with spears and shields, wherewith we have been the first men in Asia to arm ourselves; for the goddess taught this to us, as she did first to you in that country of yours. Again as regards knowledge, you see how careful our law is in its first principles, investigating the laws of nature till it arrives at divination and medicine, the object of which is health, drawing from these divine studies lessons useful for human needs, and adding to these all the sciences that are connected therewithal. With all this constitution and order the goddess established you when she founded your nation first; choosing out the spot in which ye were born because she saw that the mild temperament of its seasons would produce the highest intelligence in its people. Seeing then that the goddess was a lover of war and of wisdom, she selected the spot that should bring forth men likest to herself, and therein she first founded your race. Thus then did ye dwell governed by such laws as I have described, ay and even better still, surpassing all men in excellence, as was meet for them that were offspring and nurslings of gods.

Many and mighty are the deeds of your city recorded here for the marvel of men; but one is there which for greatness and much doubt whether the text is sound. The whole sentence reads strangely in a passage of such singular literary brilliance as this chapter. With regard to μαντικής καὶ ὀρτικῆς Proklos observes that the Egyptians combined these two professions.

15. φρονιμωτάτους ἀνδρας] Compare Laws 643 c, Menexenus 237 c foll. The Euripidean αἰὲ διὰ λαμπροτάτου βασιντες ἄφρος αλθέως will occur to everyone. How much importance was attached by Greek medical science to the influence of climate upon the nature of a people may be gathered from the treatise of Hippocrates de aere locis et aquis; cf. especially εἰρήσεις γὰρ πεῖ τὸ πλῆθος τῆς χώρης τῇ φύσι ἀκολουθεῖνα καὶ εἶδεα τῶν ἄνθρωπων καὶ τῶν τρόπων. Kühn vol. 1 p. 567. Compare too Plotinos enenad 111 i 5 ἀκολουθεῖν δὲ τῶν τόπων οὐ μόνον τὰ ἄλλα φυτά τε καὶ ξύλα, ἄλλα καὶ ἄνθρωπων εἴη τε καὶ μεγηθὲ καὶ χρῆα καὶ θυμωδὲς καὶ ἐπιθυμιὰς, ἐπιτηθεύματα τε καὶ ἄνθρωπων

22. πάντων γε μὴν ὑ] The amount of speculation and misdirected ingenuity which Plato's story of Atlantis has awakened surpasses belief. Plato is our
only authority for the legend: there is no trace of confirmation from any independent source. It appears to me impossible to determine whether Plato has invented the story from beginning to end —ῥηθίως Ἀγνύττοις καὶ ὑποδατοῖς ἀν ἐθέλῃ λέγοισ ποιεῖ—or whether it really more or less represents some Egyptian legend brought home by Solon. Stallbaum supposes that the ancient Egyptians really had some information of the existence of America. But this is entirely incredible, considering the limited powers of navigation possessed by even the boldest seafarers of those times. The greatest voyage on record was the circumnavigation of Africa related by Herodotus iv. 42: but that is mere child’s play to crossing and recrossing the Atlantic without a compass. The explorers took over two years for their enterprise and went ashore each year to raise a crop. The view that Atlantis did actually exist and disappear, as Plato describes, receives, I believe, no countenance from geology. The wild absurdity of most of the theories on the subject may be gathered from Martin’s learned and amusing dissertation. There is hardly a country on the face of the globe, not only from China to Peru, but from New Zealand to Spitzbergen, including such an eminently unpromising locality as Palestine, which has not been confidently identified with the Platonic Atlantis. It can only be said that such speculations are δεινον καὶ ἐκπύθων καὶ οὐ πάνω εὐνυχον ἀνδρός.

4. πορεύσιμον] Plato means that since
nobleness surpasses all the rest. For our chronicles tell what a power your city quelled of old, that marched in wanton insolence upon all Europe and Asia together; issuing yonder from the Atlantic ocean. For in those days the sea there could be crossed, since it had an island before the mouth of the strait which is called, as ye say, the pillars of Herakles. Now this island was greater than Libya and Asia together; and therefrom there was passage for the sea-farers of those times to the other islands, and from the islands to all the opposite continent which bounds that ocean truly named. For these regions that lie within the strait aforesaid seem to be but a bay having a narrow entrance; but the other is ocean verily, and the land surrounding it may with fullest truth and fitness be named a continent. In this island Atlantis arose a great and marvellous might of kings, ruling over all the island itself, and many other islands, and parts of the mainland; and besides these, of the lands east of the strait they governed Libya as far as Egypt, and Europe to the borders of Etruria. So all this power gathered itself together, and your country and ours and the whole region within the strait it sought with one single swoop to enslave. Then, O Solon, did the power of your city shine forth in all men's eyes glorious in valour and in strength. For being foremost upon earth in courage and the arts of war, sometimes she was leader of the Hellenes, sometimes she stood alone perforce,

the Atlantic was thickly studded with large islands, it was possible for mariners to pass from one to another by easy stages until they reached the transatlantic continent, without the necessity of a long sea voyage. We know from Thucydides that even the passage across the Ionian sea was regarded as formidable; we may readily conceive then that many halting places would be required to make the Atlantic ocean περεόνυμον.

6. Διψθς ἣν καλ' Άσιας μελζων] In estimating the size of Atlantis allowance must be made for Plato's imperfect knowledge of the magnitude of Asia and Africa.

8. τὴν κατανικρῷ πάσαν ἡπειρον] Martin suggests that the notion of a transatlantic continent may have arisen from the early conception of Ocean as a river, implying a further shore.

20. πάντων γὰρ προστάσα] The unmistakable similarity between the position of the legendary Athens in the Atlantian war and that of the historical Athens in the Persian invasion indicates that if Plato is using an ancient legend, he has freely adapted it to his own ends: for the existence of such a coincidence in the original is highly improbable.

6. τὸ τε παρ' ὑμῖν μάχιμον] We must suppose the chief fury of the earthquake was spent on Athens itself, so that all the more cultivated and intelligent citizens, who, as in Plato's own republic, included the fighting men, were destroyed; while the Attic race was continued by the rude inhabitants of country districts.

8. ἀπορον καὶ ἀδιερεύνητον] Aristotle agrees, though assigning a different reason, about the shallowness of the Atlantic near Gibraltar: cf. meteorologica 11 i 354 22 τὰ δ' ἔξω στηλῶν βραχέα μὲν διὰ τῶν πιλῶν, ἀπὸ τοῦ ἄστιν ὡς κοίλος τῆς βασάντης οὔτε. ὥσπερ οὖν καὶ κατὰ μέρος ἐκ τῶν ὑψηλῶν οἱ ποικίλοι φαινομένοι βροτοι, οὔτω καὶ τῆς δῆλη γῆς ἐκ τῶν ὑψηλότερων τῶν πρὸς ἄρκτον τὸ ἰεύμα γίνεται. τὸ

9. βραχός: βαθὸς AZ.

9. πηλοῦ κάρτα βραχός] I believe this reading to be perfectly correct, although I am unable to produce an exact parallel. βραχός was the regular word for shoals: cf. Herodotus 110 ἔλασσαν οὐκέτι πλοῖον ὑπὸ βραχών: also IV 179, and Plutarch de genio Socratis § 22 ἀραὶ τενάγαν καὶ βραχέα. The peculiarity in our passage is of course that βραχός is
when the rest fell away from her; and after being brought into the uttermost perils, she vanquished the invaders and triumphed over them: and the nations that were not yet enslaved she preserved from slavery; while the rest of us who dwell this side the pillars of Herakles, all did she set free with ungrudging hand. But in later time, after there had been exceeding great earthquakes and floods, there fell one day and night of destruction; and the warriors in your land all in one body were swallowed up by the earth, and in like manner did the island Atlantis sink beneath the sea and vanish away. Wherefore to this day the ocean there is impassable and unsearchable, being blocked by very shallow shoals, which the island caused as she settled down.

IV. You have heard this brief statement, Sokrates, of what the ancient Kritias reported that he heard from Solon: and when you were speaking yesterday about the polity and the men whom you described, I was amazed as I called to mind the story I have just told you, remarking how by some miraculous coincidence most of your account agreed unerringly with the description of Solon. I was unwilling however to say anything at the moment, for after so long a time my memory was at fault. I conceived therefore that I must not speak until I had thoroughly gone over the whole story by myself. Accordingly I was quick to accept the task you imposed on us yesterday, thinking that for the most arduous part of all such undertakings, I mean supplying a story fitly corresponding to our intentions, an adjective agreeing with πηλοῦ. But though this use does not seem to occur elsewhere, I see no conclusive reason for rejecting it here; and certainly no tolerable substitute has been offered for it. A gives βαθός, which is pointless: surely the question that would interest a sailor is how near the mud was to the surface; its depth he would regard with profound indifference. And there is little more to be said for Stallbaum’s suggestion τραχέος. Accordingly I retain πηλοῦ κάρτα βραχέος in the sense of ‘very shoal mud’.

25 D—27 B, c. iv. Kritias proceeds to say that he was greatly struck by the resemblance between the ideal common-

wealth as painted by Sokrates and ancient Athens as described in Solon’s legend. He therefore taxed his memory to recover every detail of the history, thinking it would serve to fulfil Sokrates’ wish to see his imaginary citizens brought into life and action. Sokrates welcomes the suggestion; and it is agreed that Timaeus shall first expound the order of the universe down to the creation of man, and that Kritias shall follow with his account of the former Athenians and of their war with Atlantis.

to this affirmation. 29. ἀστρονομικότατον] Not in the

popular sense merely, but in the sub-

limated Platonic manner.
we should be fairly well provided. So then, as Hermokrates said, as soon as ever I departed hence yesterday, I began to repeat the legend to our friends as I remembered it; and when I got home I recovered nearly the whole of it by thinking it over at night. How true is the saying that what we learn in childhood has a wonderful hold on the memory. Of what I heard yesterday I know not if I could call to mind the whole: but though it is so very long since I heard this tale, I should be surprised if a single point in it has escaped me. It was with much boyish delight that I listened at the time, and the old man was glad to instruct me, (for I asked a great many questions); so that it is indelibly fixed in my mind, like those encaustic pictures which cannot be effaced. And I narrated the story to the rest the first thing in the morning, that they might share my affluence of words. Now therefore, to return to the object of all our conversation, I am ready to speak, Sokrates, not only in general terms, but entering into details, as I heard it. The citizens and the city which you yesterday described to us as in a fable we will transfer to the sphere of reality and to our own country, and we will suppose that ancient Athens is your ideal commonwealth, and say that the citizens whom you imagined are those veritable forefathers of ours of whom the priest spoke. They will fit exactly, and there will be nothing discordant in saying that they were the men who lived in those days. And dividing the work between us we will all endeavour to render an appropriate fulfilment of your injunctions. So you must consider, Sokrates, whether this story of ours satisfies you, or whether we must look for another in its stead.

Sokrates. How could we change it for the better, Kritias? It is specially appropriate to this festival of the goddess, owing to its connexion with her; while the fact that it is no fictitious tale but a true history is surely a great point. How shall we find other such citizens if we relinquish these? It cannot be: so with Fortune’s favour do you speak on, while I in requital for my discourse of yesterday have in my turn the privilege of listening in silence.

Kritias. Now consider, Sokrates, how we proposed to distribute your entertainment. We resolved that Timaeus, who is the best astronomer among us, and who has most of all made it

5 δὴ pro δὲ reposui suadente S. 27 C—29 D, c. v. Timaeus, after due invocation of heavenly aid, thus begins his exposition. The first step is to distinguish the eternally existing object of thought and reason from the continually fleeting object of opinion and sensation. To which class does the material universe belong, to Being or Becoming? To Becoming, because it is apprehensible by the senses. All that comes to be comes from some cause; so therefore does the universe. Also it must be a likeness of something. Now what is modelled on the eternal must needs be fair, but what is modelled on the created
his business to understand universal nature, should speak first, beginning with the origin of the universe, and should end with the birth of mankind: and that I should follow, receiving from him mankind brought to being in theory, and from you a portion of them exceptionally cultivated; and that in accordance with Solon's laws, no less than with his statement, I should introduce them before our tribunal and make them our fellow-citizens, as being the Athenians of bygone days, whom the declaration of the sacred writings has delivered from their oblivion; and thenceforward we shall speak as if their claim to Athenian citizenship were fairly established.

Sokrates. Ample and splendid indeed, it seems, will be the banquet of discourse which I am to receive in my turn. So it would seem to be your business to speak next, Timaeus, after you have duly invoked the gods.

V. Timaeus. Yes indeed, Sokrates, that is what all do who possess the slightest share of judgment; at the outset of every work, great or small, they always call upon a god: and seeing that we are going to enter on a discussion of the universe, how far it is created or perchance uncreate, unless we are altogether beside ourselves, we must needs invoke the gods and goddesses and pray above all that our discourse may be pleasing in their sight, next that it may be consistent with itself. Let it suffice then thus to have called upon the gods; but we must call upon ourselves likewise to conduct the discourse in such a way that you will most readily comprehend me, and I shall most fully carry out my intentions in expounding the subject that is before us.

First then in my judgment this distinction must be made.

The first eight chapters of Timaeus' discourse, extending to 40 D, deal with the universe as a whole; after which he proceeds to its several portions.

21. τὸ δ' ἡμετέρον παρακλητῶν] i.e. after appealing to the gods for aid, we must appeal to ourselves to put forth all our energies: heaven helps those who help themselves.

22. ἡ διανοοῦμαι] Stallbaum proposes to read ἐ.
2. τὸ μὲν δὴ νοησεῖν νόησις καὶ δόξα denote the faculties, λόγος and αἰσθήσεις the processes. The language of the present passage precisely agrees with the account given at the end of the fifth book of the Republic.

5. ὑπ' αἰτίου τινὸς] So Philochus 26 Ε δρα γὰρ εἰ σοι δοκεῖ ἀναγκαῖον εἶναι πάντα τὰ γιγνόμενα διὰ τινὰ αἰτίαν γίγνεσθαι. Only the διὸς δὲν, the changeless and abiding, is a cause to itself and needs no αἴτια from without: the γιγνόμενον has no principle of causation in itself and must find the source of its becoming in some ulterior force.

8. τὴν ἱδέαν καὶ δύναμιν] Neither of these words has a technical meaning, though δύναμις is here not so very far removed from the Aristotelian sense. ἱδέαν = the form and fashion of it, δύναμις its function or quality.

11. ἡ καὶ ἄλλο] The universe is a living god: Plato therefore uses the customary reverent differenc in naming the divine: cf. Aeschylus Agamemnon 160 Ζεύς, ὡστὶ ποτ' ἐστίν, εἶ τὸ δ' αὐτῷ φίλον κεκλημένων. The sentence becomes an anacoluthon owing to the parenthetical words ἡ καὶ ἄλλο...ἀφωνήθω.

14. πότερον ἢν ἄει] i.e. whether it belongs to things eternal or to things temporal. It cannot be too carefully borne in mind that there is throughout no question whatsoever of the beginning of the universe in time. The creation in time is simply part of the figurative representation: it is καὶ ἐπίνοιαν only. In Plato's highly poetical and allegorical exposition a logical analysis is represented as a process taking place in time, and to reach his true meaning we must strip off the veil of imagery. He conceived the universe to be a certain evolution of absolute thought; and the several elements in this evolution he
What is that which is eternally and has no becoming, and again what is that which comes to be but is never? The one is comprehensible by thought with the aid of reason, ever changeless; the other opinable by opinion with the aid of reasonless sensation, becoming and perishing, never truly existent. Now all that comes to be must needs be brought into being by some cause: for it is impossible for anything without a cause to attain to birth. Of whatsoever thing then the Artificer, looking ever to the changeless and using that as his model, works out the design and function, all that is so accomplished must needs be fair: but if he look to that which has come to be, using the created as his model, the work is not fair. Now as to the whole heaven or order of the universe—for whatsoever name is most acceptable to it, be it so named by us—we must first ask concerning it the question which lies at the outset of every inquiry, whether did it exist eternally, having no beginning of generation, or has it come into being, starting from some beginning? It has come into being: for it can be seen and felt and has body; and all such things are sensible, and sensible things, apprehensible by opinion with sensation, belong, as we saw, to becoming and creation. We say that what has come to be must be brought into being by some cause. Now the maker and father of this All it were a hard task to find, and having found him, it represents as a succession of events. Such criticism then as that of Aristotle in de caelo 1 x is wholly irrelevant: he treats a metaphysical conception from a merely physical point of view. Stobaeus ecl. 1 450 says Πυθαγόρας φησὶ γεννητὸν καὶ ἐπίνοιαν τῶν κόσμων, οὐ κατὰ χρόνον: and presently he ascribes the same view to Herakleitos. Whether these philosophers really held that opinion there seems no means of determining; but since in the immediate context Stobaeus assigns to Pythagoras some distinctively Platonic notions, we may pretty fairly infer that the creation of the world καὶ ἐπίνοιαν was one of the many Platonic doctrines which were foisted by the later doxographers upon Pythagoras, whose school served them as a πανδοκείων for all views they had a difficulty in otherwise bestowing. As to the past tense ἦν ἦνι, Proklos very justly observes εἰ δὲ τὸ ἦν οὐ φησὶ προελθὼν οἰκείων εἶναι τοῖς αἰωνίοις, εἰ δὲ ταράττεσθαι: πρὸ γὰρ τῆς διαρκήσεως ἐπεται τῇ συνήθεια. The said διάρκεια is at 37 e—38 b.

19. εὐρείν τε ἐργον] Proklos says this is a warning against superficially seeking our ἀρχὴ in the physical forces which served the old φυσιολόγοι. It may be observed also that, were we to accept the δημιουργὸς literally, Plato would surely not have used such language in referring to so simple and familiar a conception as a personal creator of the universe; but if the δημιουργὸς is but a mythical representative of a metaphysical ἀρχή, the justice of the remark is evident.
πτέον περὶ αὐτοῦ, πρὸς πότερον τῶν παραδειγμάτων ὁ τεκτάνομενος αὐτὸν ἂπειρηγάξετο, πότερον πρὸς τὸ κατὰ ταυτὰ καὶ 20 ἀφαιτῶς ἔχων ἢ πρὸς τὸ γεγονός. εἰ μὲν δὴ ἀκαλὸς ἐστὶν δὲ τὸ κόσμος ὁ τὸ δημιουργός ἀγαθός, δῆλον ὡς πρὸς τὸ αἴδιον ἔβλεπεν· εἰ δὲ δὴ μηδὲ εἰπεῖν τινὶ θέμις, πρὸς τὸ γεγονός. παντὶ δὴ σαφὲς ὅτι πρὸς τὸ αἴδιον ὁ μὲν γὰρ κάλλιστος τῶν γεγονότων, δὲ ἀριστος τῶν αἰτίων. οὕτω δὴ γεγενημένος πρὸς τὸ λόγον καὶ φρονήσει πειρηλπτὸν καὶ κατὰ ταυτὰ ἔχων δεδημουργηται: τοῦτω δὲ ὑπαρχόντων αὐτὰ πάσα ἀνάγκη τόῳ τὸν κόσμον εἰκόνα 10 τινὸς ἐιναι. μεγιστὸν δὴ παντὸς ἀρξάσθαι κατὰ φύσιν ἄρχην. ὅδε οὖν περὶ τε εἰκόνος καὶ περὶ τοῦ παραδείγματος αὐτῆς διοριστέων, ὡς ἄρα τοὺς λόγους, ὅπερ ἐίσιν ἔξηγηταί, τούτων αὐτῶν καὶ ἐφηγενεῖς ὡντας. τοῦ μὲν οὖν μονίμου καὶ βεβαιοῦ καὶ μετὰ νοῦ καταφανοῦς μονίμους καὶ ἀμεταπτώτους, καθ’ ὤνου [ὁ]νὸν] τε 15 ἀνελεγκτοις προσῆκε λόγοις ἐιναι καὶ ἄκινήτοις, τούτων δεὶ μηδὲν ἐλέεισθεν· τοὺς δὲ τοῦ πρὸς μὲν ἐκείνου ἀπεικασθέντος ἐντὸς δὲ οἱ εἰκόνως, εἰκότας ἀνὰ λόγον τε ἐκείνων ὡντας· ὃ τί περὶ πρὸς γένεσιν οὖσα, τούτῳ πρὸς πίστιν ἀλήθεια. εάν οὖν, ὃ Σωκρατες, πολλά

3 πρὸς τὸ γεγονός: τὸ omitit A. 8 καὶ ἀντε κατὰ omitit A. 14 καθ’ δοὺν τε AZ. καθ’ δοὺν δοὺν τε καὶ H. καθ’ δοὺν δοὺν δοὺν τε S. inclusi οἶνον.
15 ἀνελεγκτοι: ἀνελεγκτοι et mox λόγους et ἀκινήτους S. δεὶ: δεὶ S.

1. πρὸς πότερον τῶν παραδειγμάτων] It may reasonably be asked, how could the creator look πρὸς τὸ γεγονός, since at that stage there was no γεγονός to look to? Plato’s meaning, I take it, is this: the γεγονός at which the Artificer would look can of course only be the γεγονός that he was about to produce. Now if he looked at this, instead of fixing his eyes upon any eternal type, that would mean that he created arbitrarily and at random a universe that simply fulfilled his fancy at the moment and did not express any underlying thought: the universe would in fact be a collection of incoherent phenomena, a mere plaything of the creator. But, says Plato, this is not so: material nature is but the visible counterpart of a spiritual reality; all things have their meaning. Creation is no merely arbitrary exercise of will on the part of the creator; it is the working out of an inevitable law.

6. καλλιστος τῶν γεγονοτῶν] i.e. there is nothing in the universe which, taken by itself, is so fair as the universe as a whole.

9. εἰκόνα τινὸς εἶναι] This leads the way to the question raised in 30 c. Seeing that the creator looked to a pattern in framing the universe, it follows that the universe is a copy of something; and we have to inquire what that is whereof it is the copy. Cicero renders these words ‘simulacrum aeternum esse aliquius aeterni’; whence it would appear that his ms. gave εἰκόνα ἄιδίων τινος ἄιδιον, which it has been proposed to restore. This however it were rash to do against all existing mss. and Proklos. The phrase εἰκόνα ἄιδιον might perhaps be defended on the same principle as
were impossible to declare him to all men. However we must again inquire concerning him, after which of the models did the framer of it fashion the universe, after the changeless and abiding, or after that which has come into being? If now this universe is fair and its Artificer good, it is plain that he looked to the eternal; but if—nay it may not even be uttered without impiety,—then it was to that which has come into being: Now it is manifest to every one that he looked to the eternal: for the universe is fairest of all things that have come to be, and he is the most excellent of causes. And having come on this wise into being it has been created in the image of that which is comprehensible by reason and wisdom and changes never. Granting this, it must needs be that this universe is a likeness of something. Now it is all-important to make our beginning according to nature: and this affirmation must be laid down with regard to a likeness and its model, that the words must be akin to the subjects of which they are the interpreters: therefore of that which is abiding and sure and discoverable by the aid of reason the words too must be abiding and unchanging, and so far as it lies in words to be incontrovertible and immovable, they must in no wise fall short of this; but those which deal with that which is made in the image of the former and which is a likeness must be likely and duly corresponding with their subject: as being is to becoming, so is truth to belief. If then, Sokrates, after so many men have said divers things concerning

αἰῶνος εἰκόνα in 37 D: but there the expression has a pointedness which is lacking here. ἀδιάδικα properly means exempt from time, and cannot strictly be applied to the phenomenal world, though its duration be everlasting.

13. τοῦ μὲν οὖν μονίμου] Some corruption has clearly found its way into this sentence. It seems to me that the simplest remedy is to reject οὖν, which I think may have arisen from a duplication of ὅν. By this omission the sentence becomes perfectly grammatical. Stallbaum, reading καὶ before καθ’ ὅν, alters ἤνελεγκτος, λόγοις, ἀκινήτος, to the accusative, and writes δὲ for δεῖ. This method does indeed produce a sentence that can be construed; but it involves larger alterations of the text, and the position of the word λόγου seems extremely unsatisfactory. I cannot therefore concede his claim to have restored Plato’s words. According to my version of the sentence εἶναι must be supplied with μονίμου καὶ ἁμεταπτῶτος.

17. ἀνά λόγου] i.e. they stand in the same relation to the λόγου of the παράδειγμα as the εἰκών to the παράδειγμα: as becoming is to being so is probability to truth. We have here precisely the analogy of Republic 511 E.
πολλῶν εἰπόντων περὶ θεῶν καὶ τῆς τοῦ παντὸς γενέσεως, μὴ δυνατοὶ γραφόμεθα πάντη πάντως αὐτοὺς ἑαυτοὺς ὁμολογομένους λόγους καὶ ἀπηκριβωμένους ἀποδόναι, μὴ θαυμάσῃ τις. ἀλλὰ ἐὰν ἄρα μὴν ἢττον παρεχόμεθα εἰκότας, ἀγαπᾷν χρῆ, μεμνημένον, ὡς ὁ λέγων ἐγὼ ὑμεῖς τις οἱ κριταὶ φύσιν ἀνθρωπινήν δὲ ἔχομεν, ὥστε περὶ τούτων τὸν εἰκότα μύθον ἀποδεχόμενος πρέπει τούτου μηδὲν ἐπὶ πέρα ζητεῖν.

Σ.Ω. Ὅριστα, ὃ Τίμαι, παντάπασι τις ὡς κελεύεις ἀποδεκτέων τὸ μὲν ὁν ὀρολόμενον ἱσαμάσιον ἀπεδεξάμεθα σου, τὸν δὲ δὴ νόμον ἡμῖν ἐφέξης πέρανεν.

VI. ΤΙ. Τέγωμεν δὴ δι' ἦν τινα αἰτίαν γένεσαν καὶ τὸ πᾶν τὸδε ὁ ἐμνιστάς ἔσχετησεν. ἀγαθὸς ἦν, ἀγαθὸν δὲ οὐδέν περὶ ἐν τούτῳ οὐδέποτε ἐγγὺς τητον δ' ἐκτὸς ὁν πάντα ὁ τι μάλιστα γενέσαν ἔβουλήθη παραπλήσια ἑαυτῷ. ταύτην δὴ 15 γενέσεως καὶ κόσμου μάλιστ' ἂν τις ἀρχὴν κυριωτάτην παρ' ἀνδρὸν φυσιμὸν ἀποδεχόμενος ὀρθότατα ἀποδέχοιτ' ἂν. Βου-30 Α ληθείς γὰρ ὁ θεὸς ἀγαθὰ μὲν πάντα, φλαυρὸν δὲ μηδὲν εἶναι

2. αὐτοὺς ἱαυτοῖς ὁμολογομένους] The modesty of Timaeus leads him rather unduly to depreciate his physical theories: it would be hard, I think, to detect any inconsistencies in them, though there may be points which are not altogether ἀπηκριβωμένα. But Plato insists with much urgent iteration upon the impossibility of attaining certainty in any account of the objects of sense. They have no veritable existence, therefore no positive truth or secure knowledge concerning them is attainable. It is his desire to keep this constantly before the reader's mind that induces Plato to refer so frequently to the εἰκῶς μύθος. The difference between the εἰκῶς μύθος and ὁ δὲ ἀριστεῖας ἀληθῆς λόγον is instructively displayed when each is invoked to decide the question of the unity of the universe. In 31 A the latter authoritatively declares the κόσμος to be one only, and gives the metaphysical reason: in 55 D all the former ventures to say is τὸ μὲν ὁν δὴ

παρ' ἡμῖν ἓνα αὐτὸν κατὰ τὸν εἰκότα λόγον περικότα μηνιεὶ, ἄλλος δὲ εἰς ἄλλα τῆς βλέψας ἐπερα δοξάσει.

9. τὸ μὲν ὁν ὀρολόμενον] The metaphor is from harp-playing: ὀρολόμεν is the prelude, νόμος the main body of the composition: cf. Republic 531 D ἦ ὡς ἵσθεν διὶ πάντα ταῦτα προολομάκαιν ταῦτα τοῦ νόμου δὲ μηδεὶς.

29 D—31 B, c. vi. What then was the cause of creation? The creator was good and desired that all things should be so far as possible good like himself. So he took the world of matter, a chaos of disturbance and confusion, and brought it to order and gave it life and intelligence. And the type after which he ordered it was the eternal universal animal in the world of ideas; that, even as this comprehends within it all ideal animals, so the visible universe should include in it all animals that are material. And as the ideal animal is of its very essence one and alone, so he created not two or many
the gods and the generation of the universe, we should not prove able to render an account everywhere and in all respects consistent and accurate, let no one be surprised; but if we can produce one as probable as any other, we must be content, remembering that I who speak and you my judges are but men: so that on these subjects we should be satisfied with the probable story and seek nothing further.

Sokrates. Quite right, Timaeus; we must accept it exactly as you say. Your prelude is exceedingly welcome to us, so please proceed with the strain itself.

VI. Timaeus. Let us declare then for what cause nature and this All was framed by him that framed it. He was good, and in none that is good can there arise jealousy of aught at any time. So being far aloof from this, he desired that all things should be as like unto himself as possible. This is that most sovereign cause of nature and the universe which we shall most surely be right in accepting from men of understanding. For God desiring that all things should be good, and that, so far as

systems of material nature, but one universe only-begotten to exist for ever.

12. ἀγαθός ἢν] Consistently with all his previous teaching Plato here makes the αὐτὸ ἀγαθὸν the source and cause of all existence; this in the allegory is symbolized by a benevolent creator bringing order out of a preexisting chaos. Of course Plato's words are not to be interpreted with a crude literalness. The cause of the existence of visible nature is the supreme law by virtue of which the one absolute intelligencedifferentiates itself into the plurality of material objects: that is the reason why the world of matter exists at all: then, since intelligence must needs work on a fixed plan and with the best end in view, the universe thus evolved was made as perfect as anything material can be. It is necessary to insist on this distinction, although, when we remember that for Plato existence and goodness are one and the same, the distinction ultimately vanishes: all things exist just so far as they are good, and no more. Thus the conception of the αὐτὸ ἀγαθὸν as the supreme cause, which is affirmed in the Republic but not expounded, is here definitely set forth, though still invested with the form of a vividly poetical allegory.

15. παρ’ ἄνδρῶν φρονίμων] Who are the φρονίμοι ἄνδρες? Probably some Pythagoreans. I have not traced the sentiment to any preplatonic thinker; but it is quite consonant with Pythagorean views: cf. Stobaeus ecl. ii 64 Σωκράτης Πλάτων ταῦτα τῷ Πυθαγόρᾳ τέλεο φρονίμον θεὸν [ἡ θεός]. Stallbaum cites the apothegm attributed by Diogenes Laertius to Thales, κάλλιστον κόσμον, ποίημα γὰρ θεόν: but this does not seem specially apposite.
I. κατά δύναμιν] To make the material universe absolutely perfect was impossible, since evil, whatever it may be, is more or less inherent in the very nature of matter and can never be totally abolished: cf. Theaetetus 176 A ἀλλ’ οὖτ’ ἀπολέσθαι τὰ κακὰ δυνάτων, ὃ Θεόδωρος ὑπεναίων γὰρ τῷ τῷ ἀγαθῷ οἷον ἡν κακῶς ἐν θεώς αὐτὰ ἑδρίσθαι, τὴν δὲ θυσίν φύσιν καὶ τὸν τὸν περιπολέ ἡν κακῶς. See also Politicus 273 β, c. Evil is in fact, just as much as perception in space and time, an inevitable accompaniment of the differentiation of absolute intelligence into the multiplicity of finite intelligences. It is much to be regretted that Plato has not left us a dialogue dealing with the nature of evil and the cause of its necessary inherence in matter: as it is, we can only conjecture the line he would have taken.

πάν ὅσον ἦν ὁρατὸν παραλαβόν] Martin finds in this passage a clear indication that chaos actually as a fact existed before the ordering of the κόσμος. But this is due to a misunderstanding of Plato’s figurative exposition. Proklos says with perfect correctness κατ’ ἐπι- νοιαν θεωρεταῖ πρὸ τῆς κοιμοποιας. The statement that the δημοτικός found chaotic matter ready to his hand is one which πολὺ μετέχει τοῦ προστυχότος. We learn in 34 c that soul is prior to matter, which can only mean that matter is evolved out of soul. What Plato expressed as a process taking place in time must be regarded as a logical conception only. When he speaks of matter as chaotic, he does not mean that there was a time when matter existed uninformed by mind and that afterwards νοῖς ἔλθον διε- κόσμησον: he means that matter, as conceived in itself, is without any formative principle of order: it is only when we think of it as the outcome of mind that it can have any system or meaning. Compare Appuleius de dogm. Plat. I viii 198 et hunc quidem mundum nunc sine initio esse dicit, alias originem habere natumque esse: nullum autem eius exordium atque initium esse ideo quod semper fuerit; nativum vero videri, quod ex his rebus substantia eius et natura constet, quae nascendi sortitae sunt qualitatem.

οὐχ ὅσυξ[αν ἄγον] The very fact that matter is described as in motion, though the motion be chaotic, is sufficient to prove conclusively that it is a phase of ψυχή, since for Plato ψυχή is the sole ἀρχή κινήσεως. κυνοῦμενον πλημμελῶς καὶ
this might be, there should be nought evil, having received all that is visible not in a state of rest, but moving without harmony or measure, brought it from its disorder into order, thinking that this was in all ways better than the other. Now it neither has been nor is permitted to the most perfect to do aught but what is most fair. Therefore he took thought and perceived that of all things which are by nature visible, no work that is without reason will ever be fairer than that which has reason, setting whole against whole, and that without soul reason cannot dwell in anything. Because then he argued thus, in forming the universe he created reason in soul and soul in body, that he might be the maker of a work that was by nature most fair and perfect. In this way then we ought to affirm according to the probable account that this universe is a living creature in very truth possessing soul and reason by the providence of God.

Having attained thus far, we must go on to tell what follows: after the similitude of what animal its framer fashioned it. To ἀτάκτως describes the condition of matter as it would be were it not derived from an intelligent ἀρχή. Aristotle refers to this passage de caelo III ii 300b 17, comparing Plato’s chaotic motion to that attributed by Demokritos to his atoms. And this philosopheme of Demokritos is doubtless what Plato had in view: such a motion as the former conceives, not proceeding from intelligence, could not produce a κόσμος. It is impossible that Plato could have imagined that this disorderly motion ever actually existed: since all motion is of ψυχή, and ψυχή is intelligent.

3. ἧμισάμενος ἀκένο τοῦτον πάντως ἀμενον] sc. τὰ ἐν ἀταξίας. Throughout this passage Plato is careful to remedy the defect he found in Anaxagoras. ‘All was chaos’, said Anaxagoras; ‘then Mind came and brought it into order’, ‘because’, Plato adds, ‘Mind thought order better than disorder’. Thus the final cause is supplied which was wanting in the elder philosopher, and we now see Mind working ἐπὶ τὸ βελτιστὸν.

7. νοὶ δ’ ἀτ χωρὶς ψυχῆς] Compare Philebus 30 c σοφία μὴν καὶ νοὶ ἀνεὐ ψυχῆς οὐκ ἂν ποτε γενολαθην. Stallbaum, following the misty light of neoplatonic inspiration, says of ψυχῆ, ‘media est inter corpora atque mentem’. But in truth νοὶ is simply the activity of ψυχῆ according to her own proper nature: it is soul undiluted, as it were; apprehending not through any bodily organs, but by the exercise of pure thought: it is not something distinct from ψυχῆ, but a particular function of ψυχῆ.

8. ψυχῆν δὲ ἐν σῶματι] Plato is here employing popular language: accurately speaking, God constructed body within soul, as we see in 36 ε. Plutarch quaest. platon. ην wrongly infers from this passage that, as νοὶ can only exist in ψυχῆ, so ψυχῆ can only exist in σῶμα. This course of is not so: the converse would be more correct, that σῶμα can only exist in ψυχή. The phrase νοὶ ἐν ψυχῇ is also an exoteric expression; for Plato is not here concerned to use technical language.
οὖν ἐν μέρους ἐδει πεφυκότων μηδενι καταξιώσωμεν· ἀτελεῖ γὰρ ἐνόκους οὐδεν τοί ἀν γένοιτο καλὸν· οὗ δ’ ἐστὶ τάλαξι ξώα καθ’ ἐν κατὰ γέννη μόρια, τούτῳ πάντων ὤμοιότατον αὐτίν εἰναι τιθομεν. τὰ γὰρ δὴ νοητὰ ξώα πάντα ἐκεῖνο ἐν ἐαυτῷ περιλαβόντι ἐξῄει, καθάπερ οὐδέ οὐ κόσμος ἡμᾶς ὡσα τε ἀλλὰ θρέμματα ἐξενηστέκεν ὦρατά. τῷ γὰρ τῶν νοομένων καλλιστῶ καὶ κατὰ πάντα διτελέος μᾶλιστα αὐτὸν ὁ θεὸς ὤμοιος ἔρημηθεις ζῷον ἐν ὄρατον, πάνθ’ ὡσα αὐτοῦ κατὰ φύσιν ἐναγγελειν ξώα ἐντὸς ἐξαύτου, ἐξενηστήσει. πότερον οὖν ὀρθῶς ἐνα ὑπαρνόν προσειρήσαμεν, ἣ 31 Α. 10 πολλοὺς καὶ ἀπείρους λέγειν ἤν ὀρθότερον; ἐνα, εἰπερ κατὰ τὸ παράδειγμα δεδημουργημένος ἐσται. τὸ γὰρ περιέχον πάντα, ὁπόσα νοητά ξώα, μεθ’ ἐτέρων δεύτερων οὐκ ἀν ποτ’ εὐη· πάλιν γὰρ ἀν ἐτέρων εἰναι τὸ περὶ ἐκεῖνο ὑναὶ ξώον, οὐ μέρος ἀν εἰπην ἐκεῖνο, καὶ οὐκ ἀν ἑτε οἰκοινοι ἀλλ’ ἐκεῖνο τῷ περιέχοντι τὸν ἀν 15 ἀφαιρομενὸν λέγοιτο ὀρθότερον. ἵνα οὖν τόδε κατὰ τὴν μόνωσιν Β. 13 ἐκεῖνο: ἐκεῖνον Λ.

1. ἐν μέρους ἐδει] Stallbaum cites Cratylus 394 D ἐν τέρατος ἐδει, Phaedo 91 D ἐν ἀρμονίας ἐδει, Republic 389 B ὡς ἐν φαρμάκον ἐδει, Hippias maior 397 B ἐν πατρόσ τινος ἰδέα.

2. καθ’ ἐν καὶ κατὰ γένη] The neoplatonic commentators are at variance whether ἐν or γένη is to be regarded as the more universal expression. I think Plato's usage is pretty conclusive in favour of taking ἐν as the more special. ἐν will thus signify the separate species, such as horse or tree; while γένη, I am disposed to think, refers to the four classes mentioned in 40 A, corresponding to the four elements to which they severally belong. In any case the αὐτὸ δ’ ἐστι ζῷον comprehends in it all the scale of inferior ideas from the four highest to the lowest species.

6. τῶν νοομένων καλλιστῶ] As we saw that the material universe is fairer than any of its parts, so the universal idea is fairer than any of the ideas which it comprehends: cf. 39 E ἵνα τόδε ὡς ὤμοιότατον ἤ τῷ τελείῳ καὶ νοητῷ ζῷοι.

8. αὐτοῦ κατὰ φύσιν ξυγγενῆ] For the construction αὐτοῦ ξυγγενῆ compare 29 B, 77 A, Philibius 11 B.

10. ἐνα, εἰπερ κατὰ τὸ παράδειγμα] The objection might occur that every other idea, just as much as the αὐτὸ ζῷον, is necessarily one and unique. That is true; but the difference lies in this: the αὐτὸ ζῷον is ἐν as being πάν; there cannot be a second αὐτὸ ζῷον, else it would not contain within it all νοητὰ ζώα. Therefore while the other particulars may be satisfactory μικρίματα of their ideas, although they are many, the ὄρατος κόσμος must be one only, else it would not copy the νοητὸ κόσμος in the essential attribute of all-comprehensiveness.

It is noticeable that in this case we have an idea with only one particular corresponding. This would have been impossible in the earlier phase of Plato's metaphysic. He says in Republic 596 A εἰδος γὰρ ποῦ τι ἐκαστον εἰσάγαμεν τιθεσθαι περὶ ἐκαστα τὰ πολλά, οἷς ταύτων δύομα ἐπιφέρομεν. But now that the ideas are restricted to ὀρθὰ φύσει, now that they are naturally determined and their existence is no longer inferred from a group of particulars, there is for Plato no reason why a natural genus should not exist containing but a single particular,
none of these which naturally belong to the class of the partial must we deign to liken it: for nothing that is like to the imperfect could ever become fair; but that of which the other animals severally and in their kinds are portions, to this above all things we must declare that the universe is most like. For that comprehends and contains in itself all ideal animals, even as this universe contains us and all other creatures that have been formed to be visible. For since God desired to liken it most nearly to what is fairest of the objects of reason and in all respects perfect, he made it a single visible living being, containing within itself all animals that are by nature akin to it. Are we right then in affirming the universe to be one, or had it been more true to speak of a great and boundless number? One it must be, if it is to be created according to its pattern. For that which comprehends all ideal animals that are could never be a second in company of another: for there must again exist another animal comprehending them, whereof the two would be parts, and no longer to them but to that which comprehended them should we more truly affirm the universe to have been likened. To the end then that in its solitude this universe might be like

But what is this αὐτὸ ἡμῶν? Surely not an essence existing outside the κόσμος, else we should have something over and above the All, and the All would not be all. It is then (to keep up Plato’s metaphor) the idea of the κόσμος existing in the mind of the δημοσφημός: or, translating poetry into prose, it is the primal έν which finds its realisation and ultimate unity through its manifestation as πολλά: there will be more to say about this on 93 c. Proklos has for once expressed the truth with some aptness: τὸ μὲν γὰρ [παράδειγμα] ἦν νοοτός παῦν, αὐτὸς δὲ [ὁ δημοσφημός] νοερός παῦν, ὁ δὲ κόσμος αἰσθητός παῦν: i.e. the παράδειγμα is universal thought regarded as the supreme intelligible, the δημοσφημός represents the same regarded as the supreme intelligence, and the κόσμος is the same in material manifestation. See introduction § 38.

Aristotle deduces the unity of the οὐρανός thus: metaphor. Λ v i i 1074 a 31 ὅτι δὲ εἰς οὐρανός φανερῶν. εἶ γὰρ πλείους οὐρανοὶ ὄσπερ ἀνθρώπου, ἐστίν εἴδει μία ἡ περὶ ἑκατὸν ἀρχή, ἀριθμὸν δὲ γε πολλαί. ἀλλ’ ὑπάρχουσιν πολλά, ὑπὲρ ἑξι…τὸ δὲ τῇ ἡ ἐχεῖν οὐκ ἔχει ὑπὲρ τὸ πρῶτον, ἐντελέχεια γὰρ. τὸν ἀρὰ καὶ λόγω καὶ ἀριθμὸ τὸ πρῶτον κυνῶν ἄκλητον. ἢ, καὶ τὸ κυνῶμενον ἀρὰ, τὸν κυνηγόμενον ἀρὰ ἀεὶ καὶ συνεχῶς εἰν μονών· εἰς ἀρὰ οὐρανός μόνον.

12. πάλιν γὰρ ἄν] Compare Republic 597 c el δύο μόνας ποιήσεις, πάλιν ἄν μία καταφεύγει, ἢς ἔχειναι ἄν αἱ ἀμφότεραι τὸ εἰς έχουν, καὶ εἶναί ἄν δο δεῖ κλίνῃ ἑκέννη, ἀλλ’ ὑπὸ αἱ δύο.

13. μέρος] i.e. a subdivision, a lower generalisation.

15. κατὰ τὴν μόνωσιν] i.e. respect of its isolation, of being the only one of its kind. This would not have called for explanation, but for Stallbaum’s strange remark ‘mox κατὰ τὴν μόνωσιν i. q. μόνον’.
VII. Σωματειδίες δε δη και όρατων ἀπτόν τε δεί το γενόμενον
5 εἰναι. χωρίσθεν δε πυρός οὐδὲν αὕτη ἢ τοτε ὁ ὅρατον γενόμενον, οὐδὲ

1. οὐτε δῦο οὐτ᾽ ἀπείρου] This is directed against the theory of Demo-
kritos, that there were an infinite number of κόσμοι: a theory which is of course
a perfectly just inference from Demo-
kritean principles.
2. εἰς δὴ μονογενῆς οὐρανὸς] Com-
pare 92 c εἰς οὐρανός δὲ μονογενῆς ὄν.
The words that follow must be under-
stood as an affirmation of the everlasting
continuance of the κόσμοι, and γεγονός,
as I have already done my best to show,
does not imply its beginning in time.
31 B—34 A, c. vii. Now the world
must be visible and tangible, therefore
God constructed it of fire and earth.
But two things cannot be harmoniously
blended without a third as a mean: there-
fore he set proportions between them.
Between plane surfaces one proportional
suffices; but seeing that the bodies of
fire and earth are solid, two proportions
were required. Therefore he created air
and water, in such wise that as fire is to
air, so is air to water, and so is water
to earth: thus the four became one
harmony. And of these substances God
used the whole in constructing the uni-
verse, so that nothing was left outside it
which might be a source of danger to
it. And he gave it a spherical form, be-
because that shape comprehends within it
all other shapes whatsoever: and he gave
it the motion therewith conformable, namely rotation on its own axis.
And he bestowed on it neither eyes nor ears
nor hands nor feet nor any organs of
respiration or nutrition; for as nothing
existed outside it, nor had it requirement
of aught, it was sufficient to itself and
needed none of these things.
4. ὁρατῶν ἀπτόν τε] Visibility and
tagility are the two most conspicuous
characteristics of matter: therefore the
fundamental constituents of the universe
are fire and earth. This agrees with the
view of Parmenides: cf. Aristotlē physica
1 v 188a 20 καὶ ἰδρ. Παρμενίδης δὲρμῶν καὶ
ψυχῆν ἀρχαῖος ποιη, ταῦτα δὲ προσαγορεῖ στόρ
καὶ γῆν: and Parmenides 112 foll.
(Karsten): see too Aristotlē de gen. et
corr. ii ix 336b 3. The four elements
the all-perfect animal, the maker made neither two universes nor an infinite number; but as it has come into being, this universe one and only-begotten, so it is and shall be for ever.

VII. Now that which came into being must be material and such as can be seen and touched. Apart from fire nothing could ever become visible, nor without something solid could it be tangible, and solid cannot exist without earth: therefore did God when he set about to frame the body of the universe form it of fire and of earth. But it is not possible for two things to be fairly united without a third; for they need a bond between them which shall join them both. The best of bonds is that which makes itself and those which it binds as complete a unity as possible; and the nature of proportion is to accomplish this most perfectly. For when of any three numbers, whether expressing three or two dimensions, one is a mean term, so that as the first is to the middle, so is the middle to the last; and conversely as the last is to the middle, so is the middle to the first; then since the middle becomes first and last, and the last and the first both become middle, of necessity all will come to be the same, and being the same with one another all will be a unity. Now if the

of Empedokles likewise reduced themselves to two: cf. Aristotle metaphor. Α ἰν 98 a 33 οὐ μὴν χρησία ἑ τέταρτον, ἀλλ' ὡς δεινὸν ὀδοὺ μόνος, πυρὶ μὲν καθ' αὐτό, τοῖς δ' ἀντικείμενοι ως μὲν φύσει, γῇ τε καὶ ἀρχα καὶ ὀσμῇ: and de gen. et corr. II iii 330 b 20. His division however does not agree with that of Plato, who classes fire air and water as forms of the same base, and places earth alone by itself.

8. δύο δὲ μόνω] Two things alone cannot be formed into a perfect harmony because they cannot constitute an ἀναλογία.

12. ἐπὶ δύκον ἐπὶ δυνάμεων 'whether cubic or square.' The Greek mathematician in the time of Plato looked upon number from a geometrical standpoint, as the expression of geometrical figures. δύκος is a solid body, here a number representing a solid body, i.e. composed of three factors, so as to represent three dimensions. δυνάμεως is the technical term for a square, or sometimes a square root; cf. Theaetetus 148 a; and here stands for a number composed of two factors and representing two dimensions. This interpretation of the terms seems to me the only one at all apposite to the present passage. Another explanation is that they represent the distinction made by Aristotle in Categories 1 vi 4 b 20 between continuous and discrete number; the former being a geometrical figure, the latter a number in the strict sense. But as our present passage is not concerned with pure numbers at all, this does not seem to the purpose.

13. δὲ τι περ τὸ πρῶτον πρὸς αὐτό] e.g. the continuous proportion 4 : 6 : 9 may either be reversed so that ἐναχτῶν becomes πρῶτων, 9 : 6 : 4 : or alternated so that the μέσον becomes ἐναχτῶν and πρῶτων, as 6 : 9 : 4 : 6, or 6 : 4 : 9 : 6. Thus, says Plato, the ἀναλογία forms a coherent whole, in which the members may freely interchange their positions.
πάντα ἐστιν, εἰ μὲν οὖν ἐπίπεδον μὲν, βάθος δὲ μηδὲν ἔχουν ἕδει γίγνεσθαι τοῦ τοῦ παντὸς σῶμα, μία μεσότης ἢ ἡ ἱπποκατὰ τά τε μεθ᾽ ἑαυτῆς ξυνεῖται καὶ ἑαυτήν· νῦν δὲ—στερεοειδὴ γὰρ Β αὐτὸν προσηθὲκεν εἶναι, τά δὲ στερεὰ μία μὲν οὐδέποτε, δύο δὲ ἄδικοι μεσότηται ξυμαρμόττουσιν· οὗτος δὴ πυρὸς τε καὶ γῆς ὦδωρ ἀέρα τε ο θεὸς ἐν μέσῳ θείοί, καὶ πρὸς ἄλληνα καθ᾽ ὄσον ἦν δυνατὸν ἀνά τον αὐτόν λόγον ἀπεργασάμενον, τό τι πέρ πῦρ πρὸς ἀέρα, τοῦτο ἀέρα πρὸς ὦδωρ, καὶ το τι ἄηρ πρὸς ὦδωρ, ὦδωρ πρὸς γῆν] ἤρχεται καὶ ἤρχεται ὀνόματον ὁρατὸν καὶ ἄπτον. καὶ διὰ ταῦτα ἐκ τε δὴ τούτων τοιούτων καὶ τὸν ἀριθμὸν τετράγων τὸ ὁ τοῦ κόσμου σῶμα ἐγεννηθή δι᾽ ἀναλογίας ὀμολογήσαν, φιλίαν τε ἐσχέν ἐκ τούτων, ὡστε εἰς ταύτων αὐτῷ ἤπειρον ἄλητον ὑπὸ τοῦ

2. μία μεσότης ἡν ἱπποκατὰ Plato lays down the law that between two plane numbers one rational and integral mean can be obtained, while between solid numbers two are required. But here we are met by a difficulty. For there are certain solid numbers between which one mean can be found; and this certainly was not unknown to Plato, who was one of the first mathematicians of his day. For instance, between 8 (2²) and 512 (8³) we have the proportion 8 : 64 :: 64 : 512. A second point, regarded by both Böckh and Martin as a difficulty, is really no difficulty at all, viz. the fact that there are plane numbers between which two means can be found, e.g. between 4 (2²) and 256 (16²) we have 4 : 16 :: 64 : 256. This is immaterial; for Plato does not say that two means can never be found between two planes, but merely that one is sufficient. The other point however does require elucidation. Böckh, who has written two able essays on the subject, offers the following explanation: 'Philosophus nos- ter non universe planorum et solidorum magnitudinem spectavit, sed solum eam comparabiliun figurarum rationem, quae fit, ubi alterum alteri inscribamus, ut supra fecimus, et ibi notatas lineas exares: idque etiam quadratis et cubisque accom- modari potest.' This he supports by a geometrical demonstration. Martin's ex- planation however (with some modifi- cations), despite Böckh's criticism of it, appears to me simpler and better. He points out that Plato's statement is true, if we suppose him to be using the words ἐπίπεδον and στερεόν in their strictest sense, so that a plane number consists of two factors only, and the solid only of three; all the factors being primes. Now it is a priori in the highest degree probable that Plato is using these terms in their strictest possible sense. Martin is not indeed correct in saying that be- tween two such strictly plane numbers two means can never be intercalated: for, given that a, b, c are prime numbers, we may have this proportion: ab : ac :: bc : ca, where ac, bc are integral. But this, as we have seen, is of no import- ance, since Plato does not deny the possi- bility of such a series, and since his ex- tremes must be squares. On the other hand, provided that both the extremes are squares, we can always interpolate a single mean between them, e.g. a² : ab :: ab : b². Again between solids formed of prime num- bers we can never (with one exception) find one rational mean: for if a³ : x :: x : b³,
body of the universe were to have been made a plane surface having no thickness, one mean would have sufficed to unify itself and the extremes; but now since it behoved it to be solid, and since solids can never be united by one mean, but require two—God accordingly set air and water betwixt fire and earth, and making them as far as possible exactly proportional, so that fire is to air as air to water, and as air is to water water is to earth, thus he compacted and constructed a universe visible and tangible. For these reasons and out of elements of this kind, four in number, the body of the universe was created, being brought into concord through proportion; and from these it derived friendship, so that coming to unity with itself it became indissoluble by any force save the will of him who joined it.

then \( x = \sqrt[3]{ab}; \) and similarly if the extremes are of the form \( a^2b \) or \( abc. \) The exception is the case \( a^2b : abc :: abc : b^2. \) We can however obtain two rational and integral means, whether the extremes be cubes or compounded of unequal factors. Howbeit for Plato’s purpose the extremes must be cubes, since a continuous proportion is required corresponding to fire : air :: air : water :: water : earth. This we represent by \( a^3 : a^2b :: a^2b : a^2 :: a^2 : b^3. \) The necessity of this proviso Martin has overlooked. Thus the exceptional case of a single mean is excluded. This limitation of the extremes to actual cubes is urged by Böckh as an objection to Martin’s theory: but surely the cube would naturally commend itself to Plato’s love of symmetry in representing his extremes, more especially as his plane extremes are necessarily squares. It is clear to my mind that, in formulating his law, Plato had in view two squares and two cubes as extremes: in the first case it is obviously possible to extract the square root of their product and so obtain a single mean; in the second it is as obviously impossible. Böckh’s defence of his own explanation is to be found in vol. III of the *Kleine Schriften* pp. 253—265. The Neoplatonists attempted to extend this proportion to the physical qualities which they assigned to the four elements in groups of three; but as these belong to them in various degrees, the analogy will not hold: e.g. mobility is shared by fire air and water, but not to the same extent in each; and similarly with the rest. As to Stallbaum’s attempt at explanation I can only echo the comment of Martin: ‘je ne sais vraiment comment M. Stallbaum a pu se faire illusion au point de s’imaginer qu’il se comprenait lui-même’.

9. διὰ ταῦτα ἐκ τε δὴ τοῦτων] ‘on this principle and out of these materials’: ταῦτα signifies the ἀναλογία, τοῦτων the στοιχεῖα. Plato is accounting for the fact that the so-called elements are four in number by representing this as the expression of a mathematical law; and thus he shows how number acts as a formative principle in nature. In φιλαν we have an obvious allusion to Empe dokles. It is noteworthy that as Plato’s application of number in his cosmogony is incomparably more intelligent than that of the Pythagoreans, so too he excels Empedokles in this matter of φιλα: he is not content with the vague assertion that φιλα keeps the universe together; he must show how φιλα comes about.
The meanings of this word.

8. άνάλογα σώματι dedi cum H e W. Wagneri coniectura. άναλογά τῷ σώματι Α. 
άναλογά τὰ σώματα SZ.
20 τελείωτο: τελείωτο Α.

Attic. The mss. for the most part have άναλογά or άναλογά τῷ σώματι. άναλογά 
σώματι is supported by Cicero's rendering 'cogwentatio corporis'.

9. περιστάμενα έξωθεν καὶ προσπίπ-
τοντα] Compare the statement in 81 D as to the cause of disease and decay.

11. έν ὀλοί] It is needless either with 
Stallbaum to read ἔνα or to change αὐτῶν 
into αὐτῷ: the meaning is 'he made it 
(the κόσμος) one single whole'.

14. τῷ περιεληφός ἐν αὐτῷ] The 
sphere is said to contain within it all 
other shapes, because of all figures 
having an equal periphery it is the great-
Now the making of the universe took up the whole bulk of each of these four elements. Of all fire and all water and air and earth its framer fashioned it, leaving over no part nor power without. Therein he had this intent: first that it might be a creature perfect to the utmost with all its parts perfect; next that it might be one, seeing that nothing was left over wherever another should be formed; furthermore that it might be free from age and sickness; for he reflected that when hot things and cold and all such as have strong powers gather round a composite body from without and fall unseasonably upon it, they undermine it, and bringing upon it sickness and age cause its decay. For such motives and reasons he fashioned it as one whole, with each of its parts whole in itself, so as to be perfect and free from age and sickness. And he assigned to it its proper and natural shape. To that which is to comprehend all animals in itself that shape seems proper which comprehends in itself all shapes that are. Wherefore he turned it of a rounded and spherical shape, having its bounding surface in all points at an equal distance from the centre: this being the most perfect and regular shape; for he thought that a regular shape was infinitely fairer than an irregular. And all round about he finished off the outer surface perfectly smooth, for many reasons. It needed not eyes, for naught visible was left outside; nor hearing, for there was nothing to hear; and there was no surrounding air which made breathing needful. Nor must it have any organ whereby it should receive into itself its sustenance, and again reject that which was already digested; for nothing went forth of it nor entered in from anywhere; for est: all others can be inscribed within it.

18. λέον δε δή] This might be supposed to be involved in what has been said: but Plato is insisting that not only is the general shape of the κόσμος spheri-
cal, but that it is a sphere without any appendages.

21. πνεύμα τε οὐκ ἢν περιεστός] This is directed against a Pythagorean fancy, that outside the universe there existed κενόν, or ἀπειρόν πνεύμα, which passed into the cavities in the universe, as though the latter were respiring it: cf. Aristotle *Physica* IV vi 213b 22 εἶναι δ' ἐφασαν καὶ οἱ Πυθαγόρειοι κενόν, καὶ ἐπειβάζονται αὐτό τῷ ὀφθαλμῷ ἕκ τοῦ ἀπειροῦ πνεύματος ὡς ἀπαντώντοι καὶ τὸ κενόν, διαρθείς τὰς φύσεις, ὡς δύνα τοῦ κενοῦ χωρισμοῦ τινὸς τῶν ἐφεξῆς καὶ τῆς διαρθείσεως καὶ τούτος εἶναι πρώτον ἐν τοῖς ἀριθμοῖς τὸ γὰρ κενὸν διαρθεία τὴν φύσιν αὐτῶν· and *Physica* III i 203a 6 οἱ μὲν Πυθαγόρειοι ἐν τοῖς αἰσθήμασιν ἅπαξ ἀφιλομεν τὸ ἀπειροῦ· οὐ γὰρ χωριστὸν ποιοῦσα τὸν ἀριθμὸν καὶ εἶναι τὸ ἔξω τοῦ ὀφθαλμοῦ ἀπειροῦ. See also Stobaeus *Eccl.* I 382.
1. *trofēn tēn ēantō phōson parēchōn*] By this striking phrase Plato means that the nutrition of one thing is effected by the decomposition of another: all the elements of which the universe is composed feed upon each other and are fed upon in turn. The idea is still more boldly expressed by Heraclitus fr. 25 (Bywater) 

2. *χειρῶν δὲ*] There is an anacoluthon: the genitive is written as though χρείᾳ τις ἦν belonged to the main clause.

3. *tēn tōν σώματος οἰκείαν*] Plato does not of course mean that the motion belongs to the body in the sense of being its own attribute, because all motion is of soul; but simply that the most perfect motion suits the most perfect form. For τῶν ἐπτὰ see 43 B: the seven are up and down, forwards and backwards, to right and to left, and finally rotation upon an axis.

4. *tēn peri νοῦν καὶ φρόνησιν*] Compare *Latos* 898 A τό κατά ταῦτα δῆσω καὶ ἑσταίτω καὶ ἐν τῷ αὐτῷ καὶ πρὶν τὰ αὐτὰ καὶ καθ’ ἑνά λόγον καὶ τάξιν μιᾶν ἁμφότεροι λέγοντες νοῦν τῆν τε ἐν ἑνὶ φερόμενην κίνησιν, σφαίρας εὐθύρου ἀπεκασμένα φοραῖς, οὐκ ἂν ποτὲ

5. *φανεῖμεν φαίλως δημιουργός λόγως καλῶν εἰκόνων.* Aristotle states his objections (which are not very cogent) to the comparison in *de anima* i iii § 15.

6. *κύκλῳ κινεῖσθαι στρεφόμενον*] If we compare the account given in the *Timaeus* concerning the motion of the *κόσμος* with that in the myth of the *Politeus*, we shall observe a peculiar and very significant discrepancy. In a passage of the latter dialogue, 269 A foll., we are told that for a fixed period God turns the universe in a given direction, making it rotate by itself for a like period in a reverse direction: its motion being the recoil from that which had been imparted by God. And this alternation recurs *ad infinitum*. Now the reason for this singular arrangement is thus stated by Plato: τό κατά ταῦτα καὶ ὡσαύτως ἔχειν ἐντὸς τῶν θεοτάτων προσέχει μόνως, σώματος δὲ φύσις οἷς τάσεις τῆς τάξεως. ὃν δὲ οὕραν καὶ κόσμου ἐπωνομάκρομεν, πολλῶν μὲν καὶ μακάριων παρὰ τῶν γεγονότων μετείληφθεν, ἀτάρ οὖν ἐνόθικαν οἷς καὶ σώματος. For this cause it was impossible to give it the same motion unchanged for ever; so God devised this ἀνακύκλισις as the slightest *parad-
there was nothing. For by design was it created to supply its own sustenance by its own wasting, and to have all its action and passion in itself and by itself: for its framer deemed that were it self-sufficing it would be far better than if it required aught else. And hands, wherewith it had no need to grasp aught nor to defend itself against another, he thought not fit idly to bestow upon it, nor yet feet, nor in a word anything to serve as the means of movement. For he assigned it that motion which was proper to its bodily form, of all the seven that which most belongs to reason and intelligence. Wherefore turning it about uniformly in the same spot on its own axis, he made it to revolve round and round; but all the six motions he took away from it and left it without part in their wanderings. And since for this revolution there was no need of feet he made it without legs and without feet.

VIII. So the universal design of the ever-living God, that

\[\lambda \alpha \xi \iota s\ from\ a\ perpetually\ constant\ motion.\]

But in the *Timaeus* the movement of the universe is changeless and everlastingly in the same direction. Now the interpretation of this difference is in my judgment indubitably this. The passage in the *Politicus* belongs to a different class of myth to the allegory of the *Timaeus*. Plato is not there expounding his metaphysical theories under a similitude; he is telling a tale with a moral to it. Therefore it suited his convenience to adopt the popular distinction between spirit and matter; and since the *κόσμος* was material, he was forced to deny it the motion peculiar to *τὸ θεὸν*. In the *Timaeus*, on the contrary, when the entire universe is the self-evolution of *νοῦς*, the distinction between spirit and matter is finally eliminated; and there is now no reason for refusing, or rather there is a necessity for assigning to the *κόσμος* the unchanging motion of the Same. I do not mean to imply that Plato’s view on this subject was different when he wrote the *Politicus*; merely that the circumstances and object of his writing were other.

34 A—36 D, c. viii. So God made the universe a sphere, even and smooth and perfect, quickened through and through with soul, alone and sufficient to itself. But he made not soul later than body, as we idly speak of it: but rather, as soul was to be mistress and queen over body, he framed her first, of three elements blended, of Same and of Other and of Essence. And when the blending was finished, he ordered and apportioned her according to the intervals of a musical scale, so that the harmony thereof pervaded all her substance. And then he divided the whole soul into two portions, which he formed into two intersecting circles; and he called them the circle of the Same and the circle of the Other: and he gave the circle of the Same dominion over the circle of the Other. And the outer circle, which is of the Same, he left undivided, but the circle of the Other he cleft into seven circles, four one way revolving and three the other; and their distances one from another were ordained according to the proportion of the seven harmonic numbers of the soul.
Aristotle's
The...neither...following

2. τὸλεον ἐκ τελεὼν σωμάτων] i.e. it was a complete whole constructed out of the whole quantity that existed of its constituent elements, as stated in 32 C.

3. ψυχὴν δὲ εἰς τὸ μέσον] Soul being unextended, this is of course metaphysical, signifying that every part of the material universe from centre to circumference is informed and instinct with soul. In the words that follow, ἐξοθέν τὸ σῶμα αὐτὴ περιεκάλυψε ταύτη, Stallbaum (who seems throughout to regard Plato as incapable of originating any idea for himself) will have it that he is following Philolaos. Now the Pythagorean πνεῦμα ἄπειρον, the existence of which is peremptorily denied by Plato in 33 C, has not a trace of community with the Platonic world-soul: nor is there any reasonable evidence that Philolaos or any other Pythagorean conceived such a soul. Plato seems by this phrase simply to assert the absolute domination of soul over body. The old physicists regarded soul or life as a function of material things, but for Plato matter is but an accident of soul: neither will he allow that soul is contained in body, as the Epicureans later held—corpus quod was quasi constitut eius, Lucr. III 440—rather she comprehends it. The same figure recurs 36 E. Aristotle's criticism in metaph. A vi 1071b 37 is based on a confusion between κατὰ χρόνον and κατ' ἐπίνοιαν.

9. οὐχ ὡς νῦν ὑστέραν] This passage ought surely to be warming enough to those who will not allow Plato the ordinary licence of a story-teller. A similar rectification of an inexact statement is to be found at 54 B.

12. τοῦ προστυχόντος τε καὶ εἰκῆ] Cf. Philebus 28 D τὴν τοῦ ἄλογου καὶ εἰκῆ δύναμι. Stallbaum has the following curious remark: 'egregie convenit cum iis quae Legum libro x. 904 A disputatur, ubi animam indelebilèm quidem esse docetur, nec vero aeternam'. This were 'inconstantia Platonis' with a vengeance: fortunately nothing of the kind is taught in the passage cited. The words are ἀνωθέσιν δὲ διὸ γενόμενον [τὸ γενόμενον Herm.] ἄλλ' οὐκ ἄλογον, ὅσπερ οἱ κατὰ νόμον διὸσ τε θεόν. Plato here plainly denies eternity, not to soul, but to the ζωτασία of soul and body, which
he planned for the God that was some time to be, made its surface smooth and even, everywhere equally distant from the centre, a body whole and perfect out of perfect bodies. And God set soul in the midst thereof and spread her through all its body and even wrapped the body about with her from without, and he made it a sphere in a circle revolving, a universe one and alone; but for its excellence it was able to be company to itself and needed no other, being sufficient for itself as acquaintance and friend. For all these things then he created it a happy god.

But the soul was not made by God younger than the body, even as she comes later in this account we are essaying to give; for he would not when he had joined them together have suffered the elder to be governed by the younger: but we are far too prone to a casual and random habit of mind which shows itself in our speech. God made soul in birth and in excellence earlier and elder than body, to be its mistress and governor; and he framed her out of the following elements and in the following

is ἀνώλεθρος, since such a mode of existence must subsist perpetually, but not αὐτὸν, since it belongs to γένεσις.

13. γενέσει καὶ ᾑρέτῃ προτέραν] The statement that soul is prior to matter in order that matter can mean nothing else but that matter is evolved out of soul: for had matter an independent ἀρχή, it would not be ὤστερον γενέσει. Again the priority is logical not temporal.

15. εἰ τῶνδε] Aristotle de anima I ii 404b 16 says τῶν αὐτῶν δὲ τρόπων καὶ Ἡλάτων ἐν τῷ Τίμαιῳ ἡν ὄψιν ἐκ τῶν στοιχείων ποιεῖ: γινώσκεσθαι γὰρ τῷ ὅμοιῳ τῷ ὑμοίῳ, καὶ τὰ πράγματα ἐκ τῶν ἀρχῶν εἶναι. This statement is in more than one respect gravely misleading. First, although it is impossible to suppose that Aristotle really meant to classify Plato's στοιχεία along with the material στοιχεία of Ἐμπέδοκλες and the rest, yet, after stating the theories of the materialists, to proceed τῶν αὐτῶν δὲ τρόπων καὶ Ἡλάτων is, to say the least, a singularly infelicitous mode of exposition. Next, while it is true that in Plato's scheme like is known by like, yet that is not the fundamental principle. The antithesis Same and Other, One and Many, is the very basis of his whole metaphysic, and must inevitably be the basis of his psychogony. γινώσκεσθαι τῷ ὅμοιῳ τῷ ὑμοίῳ is consequent, not antecedent.

τῆς ἀμερτότοι] First a word concerning the Greek. The genitives τῆς ἀμερτότοι...μερατῆς might well enough be taken with Proklos as dependent on εὗρειν, I think however they are rather to be considered as in a somewhat loose anticipative apposition to εἷς ἀμφότεροι, with which words the construction first becomes determinate. Stallbaum is certainly wrong in connecting them with εἶδος. Presently the words αὖ περὶ after τῆς τε ταυτών φύσεως are unquestionably spurious—repeated no doubt from τῆς αὖ περὶ τὰ σώματα. In the phrase del κατὰ ταυτὰ ἔχοντις ὀφθαλμὸς Dr Jackson has with some probability suggested that for ὀφθαλμὸς we should read φόσως: there is certainly an awkwardness in this use of ὀφθαλμῶν, when we have the word directly afterwards in so very peculiar and technical a sense.
This passage is obviously one of the most important in the dialogue; and it is necessary to use the utmost care in interpreting the terms. ταὐτὸν and θάτερων are in their widest and most radical sense respectively the principle of unity and identity and the principle of multiplicity and difference: but they are likewise used in special applications of these significations. Such applications are ἡ ἀμέραστος οὐσία and ἡ περὶ τὰ σώματα γεγο-μένη μερισθ, which are identical but not coextensive with ταὐτὸν and θάτερων. Regarded objectively, ταὐτὸν is the element of changeless unity in the κόσμος, the intelligible ἀρχή, θάτερων is the plurality of variable phenomena, in which the primal unity is materially and visibly manifested. The first is ἡ ἀμέραστος οὐσία, pure mind as it is in its own nature, the second is mind as it becomes differentiated into material existence. Regarded subjectively, ταὐτὸν is that faculty in the world-soul which deals with the intelligible unity, θάτερων that which deals with sensible multiplicity. One is the simple activity of thought as such, the other the operation of thought as subjected to the conditions of time and space.

But what is οὐσία? This is stated by Plato to be τρίτον ἐξ ἀμφοῖν ἐν μέσῳ τῆς τε ταὐτὸν φύοσες καὶ τῆς τοῦ ἐτέρου—a third term arising from the other two and intermediate between them. I think the nature of οὐσία will be made clearest if we take the case of an individual soul. Every one has (1) the faculty of pure thought, of reasoning apart from sensation, (2) the faculty of perceiving sensible impressions. Now if we hold that these two faculties are simply processes which go on in the brain, so that thought and perception are merely affections of the substance of the brain and nothing more—there is an end: there is no οὐσία: the two faculties have no bond of union further than they are affections of the same brain. But if we consider, as Plato did, that the physical action of the brain which accompanies thought and sensation does not constitute these, but that there is a thinking and sentient substance which acts by means of these brain-processes, at once we have a unity: the two faculties are no longer independent physical processes but diverse activities of one and the same intelligence: the subject is no more a series of consciousnesses but a conscious personality. Just so the κόσμος, being a sentient intelligence, must be conscious of itself as a whole: by ταὐτὸν it apprehends itself as unity, by θάτερων it apprehends itself as multi-
way. From the undivided and ever changeless substance and that which becomes divided in material bodies, of both these he mingled in the third place the form of Essence, in the midst between the Same and the Other; and this he composed on such wise between the undivided and that which is in material bodies divided; and taking them, three in number, he blended them into one form, forcing the nature of the Other, hard as it was to mingle, into union with the Same. And mingling them with Essence and of the three making one, again he divided this into as many parts as was meet, each part mingled of Same and of Other and of Essence. And he began his dividing thus: first he took one portion from the whole; then he went on to take a portion double of this; and the third half as much again as the

pilicity: and as these are not apart, but are activities of the same thinking subject, we have óvôla, their union as modes of one and the same consciousness. óvôla then is neither identical with ταύτων or θατέρων nor a substance apart from both: it is the identification of the two as one substance. And as in the particular soul the reasoning and perceptive faculties have no independent existence of their own, but, if they are to exist, must co-exist in a soul and thus obtain óvôla, so it is in the cosmic soul. Taken apart, both ταύτων and θατέρων are mere logical abstractions, they have no existence. Combined they instantly unite into a single óvôla; they are no longer abstract, but concrete. Thus óvôla is said to be τρίτων εξ ἄμφων, because it arises from their union. So again we see that the One and the Many cannot exist but in combination.

2. ἐν μέσῳ] i.e. it is a bond of union and connecting link between them. I would draw special attention to the fact that according as they are regarded objectively or subjectively, ἄμερης and μερωτή ὀνία have a distinct significance: they are (α) ψυχή as the primal and eternal ἐν δό, and ψυχή as evolved into a plurality of γνώμων, (β) ψυχή as dealing directly by pure thought with absolute unity, and ψυχή as dealing sensually with the multitude of material phenomena.

6. δύσμκτον ὀσαν] The element of difference and divergency was naturally refractory and hard to force into union with the rest. Plato, while convinced of the necessity of conciliating the opposites ἐν and τολλά, is fully alive to the magnitude of the undertaking.

10. ἡξετο δι διαμεῖν ὀσε] Here Plato is really pythagorising. The numbers which follow are those which compose the geometrical τετρακτύς of the Pythagoreans. This τετρακτύς is double, proceeding in one branch from 1 to 23, in the other from 1 to 33, thus:

<table>
<thead>
<tr>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>9</th>
<th>27</th>
</tr>
</thead>
</table>

It will be observed that the sum of the first six numbers, 1, 2, 3, 4, 8, 9 equals the last, 27. This τετρακτύς was significant of many things to the Pythagoreans: of these it will suffice to mention one, which Plato may have had in view in selecting these numbers: 1 denotes the point; then in the διάλασσα διαστή-
...The Pythagorean term, \( f \), is the greater of the two extremes of the arithmetic series, and the mean of the three ratios.

Next between every two members of the double and triple intervals severally he

In the dīplāsia dīaosthmatā \( 1, \frac{3}{2}, 2, \frac{4}{3}, 3, 4, \frac{16}{15}, 6, 8 \):

In the trypilāsia dīaosthmatā \( 1, \frac{3}{2}, 2, 3, \frac{5}{3}, 6, 9, \frac{22}{9}, 18, 27 \).

Insert two means, the harmonic and the arithmetical. The harmonic mean is such that it exceeds the lesser extreme and is exceeded by the greater in the same fraction of each extreme respectively: i.e. if \( x \) and \( y \) be the extremes and \( m \) the mean, \( x + \frac{x}{n} = y - \frac{y}{n} = m \). The arithmetical mean exceeds the lesser extreme by the same number whereby it is exceeded by the greater extreme, \( x + n = y - n = m \).

Thus between 6 and 12 we have 8 as the harmonic mean, 9 as the arithmetical. Now inserting these means in the two series above, we get

...being equal, produce twice as many vibrations in a given time as the longer and will give a note an octave above the first. Another string \( \frac{3}{2} \) the length of the first will give the fifth above the second string, or the twelfth above the first. Therefore we express the octave by the ratio 1:2 and the fifth by 2:3. The other ratios with which we are here concerned are 3:4, which gives the fourth; 8:9, which gives a whole tone; 16:27, which gives the (Pythagorean) major sixth; and 243:256, which will be treated of presently, but which is very nearly a semitone. Now in reckoning these ratios we may either take as our basis the number...
second and triple of the first; the fourth double of the second; the fifth three times the third; the sixth eight times the first, the seventh twenty-seven times the first. After that, he filled up the interval between the powers of two and of three by severing yet more from the original mass and placing it between them in such a manner that within each interval were two means, the first exceeding one extreme in the same proportion as it was exceeded by the other, the second by the same number exceeding the one as it was exceeded by the other. And whereas by these links there were formed in the original intervals new intervals of \( \frac{3}{2} \) and \( \frac{4}{3} \) and \( \frac{2}{3} \), he went on to fill up all the intervals of \( \frac{3}{2} \) with that of \( \frac{2}{3} \), leaving in each a fraction over; and the number of vibrations executed in a given time—as is the practice of modern musicians—or the relative lengths of string required to produce the several notes, as was usual among the Greeks. In the first case it is obvious that the ratio \( \frac{3}{2} \) expresses the octave upwards, in the second downwards. As Plato doubtless followed the latter plan, I shall follow it too—that is, we shall reckon the scales from top to bottom. Now taking the διπλαία διαστήματα with their harmonical and arithmetical means, and filling up the intervals as Plato directs, we shall have:

\[
\begin{array}{cccccc}
8:9 & 8:9 & \frac{243}{8} & 8:9 & 8:9 & \frac{243}{128} \\
1 & 9 & \frac{81}{64} & 4 & 3 & \frac{27}{16} \\
2 & 9 & \frac{81}{32} & 8 & 3 & \frac{8}{64} \\
4 & 9 & \frac{81}{16} & 16 & 6 & \frac{27}{32} \\
\end{array}
\]

The small figures denote the ratio between each term and its successor.

Now giving these intervals their musical value, we get the following scale:

![Musical Scale Image]

The original notes of the τετρακτύς are marked as semibreves, the means as minimis, and the insertions of the ἑπτάδοα and λείμματα as crotchets. Thus we get a system of three octaves in the Dorian mode, which was identical with one form of our modern minor scale.

So far all is simple. But it is not so easy to determine how the scale of τριπλάία διαστήματα should be constructed. The most obvious method is to continue the system of ἐπιτριπτά or tetrachords in the lower octaves by supplying the octaves of the means belonging to the binary system. Thus we shall have one continuous scale formed of the two sets of intervals: we shall add two more lines to our series of numbers,
But a serious, if not fatal, objection to this scale is that it does not constitute a perfect system or systems in any one of the Greek modes. It would seem then as if we must, with Westphal (Musik d. gr. Alterthums), construct the triple scale quite independently of the other. Then for each of the intervals 1 : 3, 3 : 9, 9 : 27 we shall have three dodecachords:

Here we have three conjunct dodecachords in the Dorian or Aeolian mode, passing from A minor to D minor and G minor. This scale, which is identical with that given by Westphal, does not seem free from objection; but it is more
terms of the interval forming this fraction are in the numerical proportion of $256$ to $243$. By this time the mixture, whence he cut off these portions, was all used up. Next he cleft the structure so formed lengthwise into two halves, and laying the two so as to meet in the centre in the shape of the letter X, he bent them into a circle and joined them, causing them to meet satisfactorily than any other I can suggest. The scale given by Proklos is not suitable; nor yet one which he attributes to Severus, who, supposing him to start from A minor, modulates as far as C minor. The extent of Plato's scale, four octaves and a major sixth, is far greater than any that actually occurred in Greek music, which employed at most but two octaves. It has been suggested by Proklos that Plato's reason for using so extensive a scale is that $\psi\chi\gamma$ has to apprehend not only spirit but matter, which has three dimensions; hence in the symbol the cubes 8 and 27 were required.

1. $\lambda\iota\pi\omega\nu\alpha\tau\omicron\nu\varepsilon\acute{a}\kappa\acute{a}t\omega\nu\mu\omicron\rho\omicron\omicron\nu\omega\nu$. Taking the first tetrachord of our scale, E to B, if we proceed to insert as many $\epsilon\pi\nu\gamma\delta\alpha\omicron$ as we can, we find we can introduce two, viz. E to D, D to C: a third would take us to B$'$ instead of B. This interval then, C to B, is the $\mu\omicron\rho\omicron\omega\nu$ which remains over. This is called the $\lambda\epsilon\iota\mu\mu\acute{a}$ and has the ratio $\frac{243}{256}$. The Pythagoreans held that the tone cannot be divided into two equal parts, because there is not a rational mean between 8 and 9: they accordingly distributed it into a minor semitone or $\lambda\epsilon\iota\mu\mu\acute{a}$, $\frac{243}{256}$, and a major semitone or $\alpha\prime\omicron\tau\omicron\omicron\omicron\omicron$ $\frac{2048}{2187}$, of which two the product $= \frac{8}{9}$. The Pythagorean $\lambda\epsilon\iota\mu\mu\acute{a}$ is slightly less than the ‘natural’ semitone, which is $\frac{15}{16}$ or $\frac{240}{256}$.

The pseudo-Timaeus Locrus in his abstract of this passage (96 B) says the number of terms in the series is 36: a similar view is held, according to Proklos, by some of the old Platonists; apparently for no other reason than that 36 is the sum of another double $\tau\eta\rho\acute{a}\kappa\tau\omicron\upsilon\acute{a}$ given by Plutarch, consisting of the first four odd and the first four even numbers. This number of terms is gained by forming the two scales separately and then combining them so that the apotome twice occurs; e.g. C, B, B$'$, A: the interval C—B being a $\lambda\epsilon\iota\mu\mu\acute{a}$, the interval B—B$'$ is an $\alpha\prime\omicron\tau\omicron\omicron\omicron\omicron$. But the apotome is totally foreign to Plato's scale, which is $\delta\iota\omicron\omicron\omicron\omicron\omicron\omicron\omicron\omicron\omicron$ of the strictest kind. Nor is there any Greek scale which would tolerate three half-tones successively: even in the $\chi\rho\omicron\omega\mu\alpha\tau\omicron\omicron$ only two occur in succession. Nor do I see on what plan the apotome could be made to occur twice and no more. Therefore, although this view is supported by no less an authority than Böckh, we must refuse to attribute to Plato a scale which is altogether barbarous.

7. $\omicron\upsilon\nu\chi\iota\pi\rho\omicron\sigma\beta\alpha\lambda\omega\nu$. We are to conceive the soul, after having been dully blended and having received her mathematical ratios, as extended like a horizontal band: then the creator cleaves it lengthwise and lays the two strips across each other in the shape of the letter X (i.e. at an acute angle), and so that the two centres coincide: next he bends them both round till the ends meet, so that each becomes a circle touching the other at a point in their circumferences opposite to the original point of contact. Thus we have two circles bisecting each other.
ξινάφιας αύτας τε καὶ ἄλληλαις ἐν τῷ καταντικρύ τῆς προσβολῆς, καὶ τῇ κατὰ ταύτα καὶ ἐν ταύτῳ περιαγομένῃ κινήσει περίξ αύτας ἔλαβε, καὶ τὸν μὲν ἔξω, τὸν δὲ ἐντὸς ἐποιεῖτο τῶν κύκλων. τὴν μὲν οὖν ἔξω φορᾶν ἐπεφήμισεν εἶναι τῆς ταυτοῦ φύσεως, τὴν 5 δὲ ἐντὸς τῆς θατέρου. τὴν μὲν δὲ ταύτῳ κατὰ πλευρὰν ἐπὶ δεξιὰ περιήγαγε, τὴν δὲ θατέρου κατὰ διάμετρον ἐπὶ ἀριστερὰ, κράτος δὲ ἐδοκε τῇ ταυτῷ καὶ ὀμοίου περιφοράς, μιᾶν γὰρ αὐτὴν ἀσχίν. στον εἰάσε, τὴν δὲ ἐντὸς σχίσας ἐξαχῦ ἐπτὰ κύκλους ἀνίσους κατὰ

3 αὐτάς: αὐτῆς Α.

and inclined at an acute angle. The obliquity of the inclination is insisted on, because, as we shall presently see, the two circles represent respectively (amongst other things) the equator and the ecliptic.

2. περὶς αὐτὰς ἔλαβε[1] As the soul was interfused throughout the whole sphere of the universe, we must regard the two circles simply as a framework, so to speak, denoting the directions of the two movements. These two circles are encompassed by a moving spherical envelope, being the circumference of the entire sphere of soul, revolving κατὰ ταύτα καὶ ἐν ταύτῃ.

3. τὸν μὲν ἔξω] The circle of the Same is made exterior, because it was to control the circle of the Other, and also because it symbolises the sphere of the fixed stars.

5. κατὰ πλευρὰν] This expression will be readily understood by means of the accompanying diagram. ACE, CDG

are two circles in different planes, cutting each other at the points C, D. AB and CD are their respective diameters, bisecting one another in H. The dotted lines are a parallelogram inscribed in the circle ACE, having its sides ED, CF parallel to AB and having CD for its diagonal. The rotation of the circle ACE, which is the circle of the Same, is κατὰ πλευρὰν, in the direction of DE; that is, its axis is perpendicular to DE or AB, and it revolves from east to west. CDG, the circle of the Other, rotates κατὰ διάμετρον, i.e. in the direction of the diagonal CD, from WSW to ENE. The Greek term ἂ διάμετρος generally means diagonal, not diameter. Proklos sees a special significance in the circle of the Other moving κατὰ διάμετρον, inasmuch as (the sides of the rectangle being expressed by integral numbers) the diagonal is irrational. It is quite possible that Plato may have thought of this: but, as Böckh has remarked, unless the rectangle is a square, the diagonal is not necessarily a surd: e.g. if the sides are 3 and 4, the diagonal will be 5.

ἐπὶ δεξιὰ... ἐπὶ ἀριστερὰ[2] This has given rise to much discussion, because according to the usual Greek nomenclature the east was the right side of the heavens and the west the left: and so we have it in Laws 760 D τὸ δὲ ἐπὶ δεξιὰ γιγνέσθω τὸ πρὸς ἑω: cf. Epinomis 987 b. This mode of reckoning seems to have arisen from the fact that the Greek diviners stood facing the north in taking the omens. I think the explanation of Plato’s present departure from ordinary custom is simple enough. The diurnal motion
of the universe is visible only by the daily motion of the heavenly bodies, especially the sun. An observer in Europe can only see the sun’s motions by looking towards the south, when of course the west is on his right hand: compare Pliny natur. hist. vi § 24 (of some visitors from the tropics) sed maxume mirum iis erat umbras suas in nostrum caelum cadere, non in suum, solemque a laeva oriri et in dextram occidere potius quam e diverso. Plato’s use of the terms right and left seems then perfectly natural. The universe being a sphere, Plato knew that the right and left, like up and down, are perfectly arbitrary terms (see 62 c foll.) and he therefore did not hesitate to apply them just as suited his purpose. Those who are curious on the subject may find (to put it mildly) some very singular arguing in the opposite sense in Aristotle de caelo I I i 28.4 b 6 foll.

6. κράτος δ’ ἔδωκε τῇ ταῦτῳ] That is, while the circle of the Other retains its independent rotation round its own centre, it is also carried round by the revolution of the Same.

ξάριστον ἔδαρε] Note that though the circle of the Same is one and undivided, it contains the same mathematical ratios as the Other: this clearly signifies that the multiplicity of the Other is only a different form of the unity of the Same—there exists in immaterial soul a law or principle which, when expressed in terms of matter (or here rather of the apprehension of matter), assumes the form of these mathematical ratios. Note also that the portion of the soul which constitutes the circle of the Same is composed both of Same and of Other, as also is the circle of the Same. The antithesis Same and Other pervades all ωὐσία from highest to lowest.

8. οὐσίας ξαρίστα] The circle of the Other is subdivided into seven concentric circles corresponding to the seven planets which were reckoned in Plato’s day. These are ordered at distances from the earth corresponding to the seven numbers of the τετρακτύς: 1 represents the distance of the moon, 2 the sun, 3 Venus, 4 Mercury, 8 Mars, 9 Jupiter, 27 Saturn.

The question might suggest itself, how would Plato have been affected, had he become aware that the real position of the heavenly bodies is widely different from his supposition? In my judgment he would have been absolutely unconcerned. How these bodies are situated is to him a matter of profound indifference: what does concern him is that wherever they are and whatever they do should be the result of the orderly evolution of υἱός. For it should be borne in mind that, strange and fantastic as this ψυχογομία may seem at first sight, Plato has but one aim steadily in view throughout. Whatever exists and happens in material nature is simply the material symbol of immaterial truth: it is the inevitable result of the regular evolution of spirit, according to the eternal law of its nature,
in corporeal manifestation. Plato does not of course mean that the immaterial and indivisible essence of soul is composed of circles and distributed in mathematical proportions. The circle is with him a common symbol of the activity of thought: and by assigning the harmonic numbers to soul he declares that whatever relations or harmonies, mathematical or otherwise, are found in the world of space and time, these are the natural expression in material terms of some eternal law of soul. It is perhaps advisable to notice this, because of the amusing literalness with which Aristotle has treated the subject in de anima 1 iii 407a 2 foll.—a piece of criticism which at first it is hard to believe was intended seriously.

2. κατὰ τάναντια] As seven circles cannot all be contrary each to each, we are to suppose that the three planets having the same period revolve in one direction, and the four others in the opposite. It is usually supposed that Mercury and Venus alone have the contrary motion; but if Plato's theory is to be anything like an explanation of the facts, the sun must have the same direction as these two: see note on 38 ν τῆς ἑκατέρων τριών ἐκ-ληξτὰς αὐτῷ δύναμιν, where the motive for this arrangement is discussed. In the parallel passage of the Republic, 616d—617c, it is not said that any of the planets have a contrary motion, though it is stated that Venus, Mercury and the Sun complete their orbits in the same period. The harmonic numbers of the Timaeus seem to be represented by the eight Sirens, who stood on the σφώνδυλοι, each singing one tone. In the Republic there are eight spheres, because the fixed stars are included, which here are assigned to the circle of the Same. For Aristotle's views about the music of the spheres see de caelo 11 ix 290b 12 foll.: he thinks the idea κομψόν, ἐμμελέτη, and μουσικόν, but cannot believe it.
double and triple intervals severally, each being three in number; and he appointed that the circles should move in opposite directions, three at the same speed, the other four differing in speed from the three and among themselves, yet moving in a due ratio.

IX. Now after that the framing of the soul was finished to the mind of him that framed her, next he fashioned within her all that is bodily, and he drew them together and fitted them middle to middle. And from the midst even unto the ends of heaven she was woven in everywhere and encompassed it around from without, and having her movement in herself she began a divine beginning of endless and reasonable life for ever and evermore. Now the body of the universe has been created visible; but she is invisible, and she, even soul, has part in reason and in harmony. And whereas she is made by the best of all whereunto belong reason and eternal being, so she is

existence: for when, by the circle of the Other she deals with sensibles, she forms sure opinions and beliefs; but when by the circle of the Same she apprehends intelligible being, then knowledge and reason, which soul alone possesses, are made perfect in her.

5. κατὰ νοῦν] Probably, as in Phaedo 97 D, there is a double meaning in these words 'to his mind', and 'according to reason'.

6. μετὰ τοῦτο] τὸ δὲ μετὰ τοῦτο μὴ χρωμικῶν ὑπολαβής, ἀλλὰ τάξεως σημαντικῶν, says Proklos very rightly.

7. μόσον μόη] Soul, being immaterial, has of course no centre. The phrase simply means that the whole sphere of material nature from centre to circumference was instinct with the indwelling vital force. πάντης διαπλακέως, i.e. she interpenetrated its every particle, being everywhere present in her two modes of Same and of Other.

9. Ἐφθανεν περικαλύψασα] See note on 34 B. Plutarch de anim. procr. § 21 says Palto is ὁσπέρ ἄπωθομενος τῇ ψυχῆς τὴν ἐκ σώματος γένεσιν. Compare Plotinos ennead 11 ix 7 ἐν γὰρ τῇ πάσῃ ψυχῇ η τοῦ σώματος φύσις δεδεμένη ἦδη συνδεί δ ἀν περιλάβη, αὐτὴ δὲ η τοῦ παντός ψυχῆς οὐκ ἂν δεότο ὑπὸ τῶν ψή αὐτῆς δεδεμένων.

10. οὕτω] Again of course a beginning κατ' ἐπίνοιαν only.

11. καὶ τὸ μὲν δὴ σῶμα] So Latoes 898 D ἥλιον πᾶς ἀνθρώπου σώμα μὲν ὄρη, ψυχὴν δὲ οἴδεις.

12. λογισμοῦ δὲ μετέχουσα καὶ ἀρμονίας ψυχῆς] Notwithstanding Stallbaum's defence of ψυχῆ, I feel strong misgivings as to its genuineness: its position is strange and disturbs the connexion.

τῶν νοητῶν ἀλτε ὑττων] It is very significant that the δημιουργός is identified with the object of reason, νοῦς with νοητῶν. Here then we have another token that the δημιουργός is merely a mythological representative of universal νοῦς which evolves itself in the form of the κόσμος. Still more remarkable is the use of λογιστικῶν below in 37 C. There is no other passage in Plato where λογιστικῶν is contrasted with ἀλαιθής: the regular term is of course νοητῶν. It is surely impossible that Plato could have substituted λογιστικῶν for νοη-
γεννηθέντων. ἂτε οὖν ἐκ τῆς ταύτου καὶ τῆς θατέρου φύσεως ἐκ τε οὐσίας τριῶν τούτων συγκρατείσα μοιρῶν, καὶ ἀνὰ λόγων μερισθείσα καὶ ἑξουσθείσα, αὐτῇ τε ἀνακυκλουμένη πρὸς αὐτήν, ὅταν οὐσίαν σκεδαστὴν ἐξουσίαν τινος ἐφαπτυται καὶ ὅταν ἀμέσως ῥιστον, λέγει κινουμένη διὰ πάσης ἐαυτῆς, ὅταν τ' ἂν τι ταύτων ἦ καὶ ὅτου ἄν ἔτερων, πρὸς οὗ τ' ἐν τε μαλλιστα καὶ ὅτη καὶ ὅτως καὶ ὅποτε ξυμβαίνει κατὰ τὰ γιγνόμενα τε πρὸς ἐκαστον ἑκαστα εἶναι καὶ πάσχειν καὶ πρὸς τὰ κατὰ ταύτα ἐχοντα αἰεί. λόγος δὲ ὁ κατὰ ταύτων ἀλήθης γιγνόμενος περὶ τα θάτερων ἄν καὶ περὶ τὸ ταύτων, ἐν τῷ κινομένῳ ὑφ' αὐτοῦ φερόμενος ἀωει φθογγον καὶ ἡχῆς, ὅταν μὲν περὶ τὸ αἰσθητικ γίγνηται καὶ ὁ τοῦ θατέρου κύκλος ὤρθος ἄν εἰς πάσαν αὐτὰ τὴν ψυχῆν διαγεγέρτη, δόξαι καὶ πίστεις γίγνονται βέβαιοι καὶ ἀλήθεις ὅταν δὲ αὐτοὶ τοῖς λογιστικοῖς ἦ καὶ ὁ τοῦ ταύτων κύκλος εὕτροχος ἄν αὑτὰ μηνύσῃ, καὶ 15 νοὺς ἐπιστήμην τε εξ ἀνάγκης ἀποτελεῖται τούτω δὲ ἐν φ' τῶν

7 ξυμβαίνει: ξυμβαίνη Α. 9 ὅπ' ὅπ' ΑΗ. 12 αὐτὰ σcripsi: αὐτὸν ΑΗSZ.

tὸν until he had reached a period in his metaphysic where he deliberately affirmed the identity of thought and its object. I believe also his present use both of ὑποτον and of λογιστικὸν is purposely designed to draw attention to this.

3. μερισθείσα καὶ ἑξουσθείσα] καὶ μερισθείσα refers to the original distribution of the soul according to the seven numbers of the τετρακτύς, ἑξουσθείσα to the introduction of the δεσμολ, the arithmetical and harmonical means which mediated between them.

αὐτῇ τε ἀνακυκλουμένη πρὸς αὐτήν] This is merely Plato's favourite metaphor describing the activity of thought, which is complete and perfect in itself.

4. οὖσιάν σκεδαστὴν] Formerly called ἦ κατὰ τὰ σώματα μεριστή: i.e. οὖσια which appears in the form of plurality, sensible phenomena, opposed to ἀμέριστον, which is ὑποτον.

5. κινουμένη διὰ πάσης έαυτῆς] This is the consequence of the soul being composed not only of ταύτων and ἐκτερων but of οὖσια. Had the circles of Same and Other been the only possession of the soul, the experiences of each circle might have been confined to it; but now, since the elements of ταύτων and ἐκτερων are unified in οὖσια, the reports received from either circle are the property of the whole soul.

ὅτω τ' ἂν τι ταύτων ἦ] Stallbaum, affirming that no one has hitherto understood this passage, takes the antecedent of ὅτω as the subject of ξυμβαίνει: 'she declares of that wherewith anything is the same and wherefrom it is different, in relation to what &c'. It may well be doubted whether he has thus improved upon his predecessors. Surely the discernment of sameness and difference is a function necessarily belonging to soul and necessarily included in the catalogue of her functions: yet Stallbaum's rendering excludes it from that catalogue. The fact that we have ὅτω ἄν ἦ, not ὅτω εστὶ, does not really favour his view—'with whatsoever a thing may be the same, she declares it the same'. I coincide then with the other interpreters in regarding the whole sentence from ὅτω τ' ἂν as indirect interrogation subordinate to λέγει.

6. πρὸς ὅ τ' τε μάλιστα] Lindau has justly remarked that all or nearly all
the best of all that is brought into being. Therefore since she is formed of the nature of same and of other and of being, of these three portions blended, in due proportion divided and bound together, and turns about and returns into herself, whenever she touches aught that has manifold existence or aught that has undivided, she is stirred through all her substance, and she tells that wherewith the thing is same and that wherefrom it is different, and in what relation or place or manner or time it comes to pass both in the region of the changing and in the region of the changeless that each thing affects another and is affected. This word of hers is true alike, whether it deal with same or with other, without voice or sound in the self-moved arising; and when she is busied with the sensible, and the circle of the other, being true, announces it throughout all the soul, then are formed sure opinions and true beliefs; and when she is busy with the rational, and the circle of the same declares it, running smoothly, then reason and knowledge cannot but be made perfect. And in whatsoever existing thing these two are

Aristotle's ten categories are to be found in this sentence.

8. \( \text{πρὸς τὰ κατὰ ταύτα} \) This phrase is exactly parallel to \( \text{κατὰ τὰ γεγομένα} \) above. The only reason for the change of preposition is the obvious lack of euphony in \( \text{κατὰ τὰ κατὰ ταύτα}. \)

\( \text{λόγος} \) 'her verdict'. \( \text{λόγος = δ λέγει}, \) what she pronounces concerning that which is submitted to her judgment. Stallbaum aptly refers to \( \text{Sophist} \) 263 \( \varepsilon \) νοικοῦ διάνοια μὲν καὶ \( \text{λόγος ταύτων} \) πλῆρ \( \text{ἐν} \) \( \text{ἐντὸς τῆς} \) \( \text{ψυχῆς} \) πρὸς \( \text{αὐτὴν} \) διάλογος \( \text{ἄνευ} \) \( \text{φωνῆς} \) \( \text{γεγομένου} \) \( \text{τοῦ} \) \( \text{αὐτὴ} \) \( \text{ἡμών} \) \( \text{ἐπωνομάσθη}, \) διάνοια. See too \( \text{Philobus} \) \( \text{39} \) \( \text{λ.} \), and \( \text{Theætetus} \) \( \text{189} \) \( \text{ε} \), where Sokrates defines \( \text{διαφορέσσαι} \) as \( \text{λόγον} \) \( \text{ἐν} \) \( \text{αὐτή} \) \( \text{πρὸς} \) \( \text{αὐτὴν} \) \( \text{ἡ} \) \( \text{ψυχὴ} \) \( \text{διεξέρχεται} \) \( \text{περὶ} \) \( \text{ὡς} \) \( \text{ἄν} \) \( \text{σκοπῇ}. \)

9. \( \text{κατὰ ταύτων} \) is adverbial, 'equally': there is nothing in it of the technical sense of \( \text{ταύτων}. \)

10. \( \text{ἐν τῷ} \) \( \text{κινομένῳ} \) \( \text{ὑπ’} \) \( \text{αὐτοῦ} \) i.e. \( \text{ἐν} \) \( \text{ψυχῇ}, \) \( \text{ψυχῇ} \) being \( \text{αὐτοκίνητος}. \)

12. \( \text{ὁρθὸς} \) \( \text{ὡς} \) Proklos draws attention to the difference of the language applied to the two circles; of the circle of the same it is said \( \text{εὐτροφὸς} \) \( \text{ὡς} \). The change of expression is readily understood if we turn to \( \text{43} \) \( \text{δ} \) foll. where Plato is speaking of the disturbance of the circles by the continuous influx of bodily nutriment: the circle of the other is distorted and displaced, but the circle of the same is only blocked (ἐπέθεσαν).

11. \( \text{αὐτὰ την} \) \( \text{ψυχῆν} \) \( \text{διαγγέλλῃ} \) The ms. reading \( \text{αὐτῆς} \) is clearly wrong, though Martin defends it. Stallbaum proposes \( \text{αὐτῷ} : \) but as we presently have \( \text{αὐτὰ} \) referring to \( \text{λογιστικοῦ}, \) that is perhaps more likely to be right here.

13. \( \text{μέθοδος καὶ} \) \( \text{ἀλήθειά} \) There is a slight chiasmus: \( \text{μέθοδος} \) is appropriate to \( \text{πίστεις} \) and \( \text{ἀλήθεια} \) to \( \text{δίδαι}. \)

\( \text{περὶ τὸ} \) \( \text{λογιστικὸν} \) \( \text{ἡ} \) Of the peculiar use of \( \text{λογιστικῶν} \) I have already spoken. Note however that the verb is changed from \( \text{γίνεσθαι} \) to \( \text{ἡ} \) and for \( \text{διαγγέλλῃ} \) we have the more authoritative word \( \text{μηνύῃ}. \)

15. \( \text{τοῦτο δὲ} \) There has been much
discuss...
found, if a man affirm it is aught but soul, what he says will be anything rather than the truth.

X. And when the father who begat it perceived the created image of the eternal gods, that it had motion and life, he rejoiced and was well pleased; and he bethought him to make it yet more nearly like its pattern. Now whereas that is a living being eternally existent, even so he essayed to make this All the like to the best of his power. Now so it was that the nature of the ideal was eternal. But to bestow this attribute altogether upon a created thing was impossible; so he bethought him to make a moving image of eternity, and while he was ordering the universe he made of eternity that abides in unity an eternal image moving according to number, even that which we have

the face of the explicit declaration a few lines later, is an additional proof, if more were wanted, that the creation of the κόσμος is pure allegory. For if Plato meant to be understood literally, he is flagrantly violating his own law.

9. εἰκὼ δ' ἐπινοεῖς] Plato's meaning in terming time the εἰκὼν of eternity may thus be stated. As extension is to the immaterial, so is succession to the eternal. The material universe is the εἰκὼν of pure being or thought: that is to say, it is the mode in which the One manifests itself in the form of multiplicity. Now the two main characteristics of material existence are (a) extension, (b) succession. The universe then regarded as extended is the εἰκὼν of νοῦς regarded as unextended: the same universe regarded as a succession of phenomena is the εἰκὼν of νοῦς regarded as eternal. As then space is the image of the immaterial, so is time the image of the eternal: space and time being the conditions under which the spaceless and timeless εὖ evolves itself in the apprehension of finite intelligences.

11. κατ' ἀριθμὸν λογον] i.e. moving by measurable periods: the ἀριθμὸς is the temporal reflection of the changeless εὖ of eternity.
χρόνον ὁνομάκαρεν. ἡμέρας γὰρ καὶ νῦκτας καὶ μῆνας καὶ ἕναυτος, οὐκ ὄντας πρὶν οὐρανὸν γενέσθαι, τότε ἀμα ἐκεῖνος ἐξουσιασμένος ἐν ἡ γένεσιν αὐτῶν μηχανάται ταῦτα δὲ πάντα μέρη χρόνου, καὶ τὸ τ' ἤν τὸ τ' ἦσται χρόνου γεγονότα εἰδὴ, ἓ δὴ 5 φέρουσε λανθάνομεν ἐπὶ τῇ ἁίδιον οὐσίαιν οὐκ ὀρθῶς. λέγομεν γὰρ δὴ ὡς ἦν ἐστὶ τε καὶ ἦσται, τῇ δὲ τὸ ἐστὶ μόνον κατὰ τὸν ἡλίον λόγον προσήκει, τὸ δ' ἦν τὸ τ' ἦσται περὶ τὴν ἐν χρόνῳ 38 ἡ γένεσιν ἤδυσαν πρέπει λέγεσθαι: κινήσεις γὰρ ἦστοι: τὸ δὲ αἱ κατὰ ταῦτὰ ἔχον ἀκινήτως οὔτε πρεσβύτερον οὔτε νεώτερον προσ-

10 ἡκεῖ γέγνεσθαι διὰ χρόνου οὐδὲ γενέσθαι ποτὲ οὐδὲ γεγονέναι νῦν οὐδ' εἰσαθῆς ἐσεθαί, τὸ παράπαν τε οὐδέν ὅσα γένεσις τοῖς ἐν αἰσθήσει φερομένωσι προσήξεν, ἀλλὰ χρόνου ταῦτα αἰώνα μιμομένου καὶ κατ' ἀριθμὸν κυκλομένου γέγονεν εἴδη. καὶ πρὸς τούτοις ἔτι τὰ τούτα, τὸ τε γεγονός εἶναι γεγονὸς καὶ τὸ Β 15 γεγομένου εἶναι γεγομένου, ἔτι δὲ τὸ γεγοςιμένου εἶναι γεγο-

σιμένου καὶ τὸ μὴ ὅν μὴ ὅν εἶναι, ὃν οὐδὲν ἀκριβὲς λέγομεν.

περὶ μὲν οὐ τούτων τάχθ' ἃν οὐκ εἰκαρὸς πρέπουσιν ἐν τῷ παρόντι διακριβολογεῖσθαι.

4 καὶ post ἤν inserit A. 12 αἰώνα : αἰώνά τε SZ. 15 ἔτι δὲ : ἔτι τε Λ. 4. γεγονότα εἰδή] i.e. forms or modes of time, and therefore belonging to γένεσις.

6. τῇ δὲ τὸ ἔστι] This passage leaves no doubt about the perfect clear-

ness of Plato's conception of eternity as distinguished from time. Eternity is quite another thing from everlasting du-

ration: it is that which μέλει ἐν ἐν, it is apart from time and has nothing to do with succession. Time has been and shall be for everlasting; but the infinity of its duration has nothing in common with eternity, for it is a succession. Plato, as he was certainly the first to form a real conception of immateriality, was probably the first who firmly grasped the notion of eternity. Parmenides indeed uses similar language, verse 64 (Karsten), οὐποτ' ἐν ἐν ἔσται, ἐπεὶ νῦν ἐστὶν ὀμοῦ πᾶν ἐν ἐξωχές. But the materiality attaching to his conception of ἐν renders it very doubtful whether he actually realised the full meaning of.

evolution of thought. It is eternal, not as an aggregate, but as a whole.

1. ἡμέρας... ἕναυτος] There is a slight anacoluthon, τὴν γένεσιν αὐτῶν being substituted for the original object.

2. οὐκ ὄντας πρὶν οὐρανὸν γενέσθαι] That is to say, time and its divisions are not logically conceivable without the existence of a world of phenomena: if there is to be succession, there must be things to succeed each other. But as there is no beginning of the κόσμος in time, there is no beginning of time itself. Aristotle, with his usual confusion between metaphor and substance, accuses Plato of generating time in time: ψυχικα ἑπὶ 251b 17 Πλάτων δ' αὐτῶν γενεν' μόνος. In Plato's narrative no other mode of expressing it would be ad-

missible. Proklos well says χρόνος γὰρ μετ' οὐρανοῦ γέγονεν, οὐ χρόνου μόριον, ἀλλ' ὁ πᾶς χρόνος, ὥστε ἐν τῷ ἀπείρῳ χρόνῳ γίνεται ο οὐρανός καὶ ἀνέκλειπτός ἐστιν ἐπ' ἐκάτερα καθάπερ ὁ χρόνος.
named time. For whereas days and nights and months and years were not before the universe was created, he then devised the generation of them along with the fashioning of the universe. Now all these are portions of time, and was and shall be are forms of time that have come to be, although we wrongly ascribe them unawares to the eternal essence. For we say that it was and is and shall be, but in verity is alone belongs to it: and was and shall be it is meet should be applied only to Becoming which moves in time; for these are motions. But that which is ever changeless without motion must not become elder or younger in time, neither must it have become so in the past nor be so in the future; nor has it to do with any attributes that Becoming attaches to the moving objects of sense: these have come into being as forms of time, which is the image of eternity and revolves according to number. Moreover we say that the become is the become, and the becoming is the becoming, and that which shall become is that which shall become, and not-being: is not-being. In all this we speak incorrectly. But concerning these things the present were perchance not the right season to inquire particularly.

this. It may even be doubted whether Aristotle, though Plato had preceded him, held an equally clear view: see for instance de caelo i ix 279a 23 foll. With the present passage may be compared the minute discussion in Parmenides 140E—142A.

8. καίνεσεν γὰρ ἔστον] i.e. they imply succession.

13. κατ' ἄριθμον κυκλομένου] i.e. fulfilling regular periodic cycles, such as years months and days.

14. τὸ γεγονὸς εἶναι γεγονός] One inaccuracy of which we are guilty is to apply the terms ἦν and ἐσται to eternity: a second is to apply ἐστί to phenomena and to non-existence. To say that γεγονὸς ἐστι γεγονός is incorrect; for even as we say ‘is’, it has changed from what it was: it is ever moving and we can find no stable point where we can say it is.’ Compare Plutarch de el apud Delphos § 19. Again to say μὴ ἄν is μὴ ἄν is absurd and contradictory. It might be rejoined that Plato has himself proved that μὴ ἄν does in a certain sense exist: Sophist 259Α ἔστι σαφεστάτα ἐκ ἀνάγκης εἶναι τῷ μὴ ἄν. And in Parmenides 162Α he shows that δεῖ αὐτῷ δεσμὸν ἔχειν τῷ μὴ εἶναι τοῦ εἶναι μὴ ἄν, εἰ μέλλει μὴ εἶναι. In the Sophist however Plato, by elucidating the true nature of μὴ ἄν, is controverting the logical and metaphysical errors which arose from assuming that μὴ ἄν was an absolute contradictory of ἄν, and from ignoring the copulative force of ἐστί. Here he is complaining of that very use of ἐστίν as a copula: it is wrong, he says, that the word should have been employed for that purpose: it is the inaccuracy of human thought represented in language.

38 β—39 Ε, ε. xi. So time is created
XI. Χρόνος δ’ οὖν μετ’ οὕρανον γέγονεν, ἵνα ἀμα γεννηθέντες ἁμα καὶ λυθόσιν, ἢν ποτε λύσις τις αὐτῶν γέγονηται, καὶ κατὰ τὸ παράδειγμα τῆς διαιωνίας φύσεως, ἵν’ ὡς ὁμοίωτας αὐτῷ κατὰ δύναμιν ἃ’ τὸ μὲν γὰρ δὴ παράδειγμα πάντα αἰσθάναται ἐστὶν ο’ δ’ αὖ διὰ τέλους τὸν ἀπάντα χρόνον γεγονός τε καὶ ὃν καὶ ἐσόμενος. εἴ’ ὅν λόγον καὶ διανοίας θεοῦ τοιαύτης πρὸς χρόνου γένεσιν, [Ἰ]νὰ γεννηθῇ χρόνος, ἦλιον καὶ σελήνη καὶ πέντε ἄλλα ἀστρα, ἐπίκλην ἐξουσία πλανητά, εἰς διορισμὸν καὶ φυλακὴν ἀριθμὸν χρόνου γέγονε. σώματα δὲ αὐτῶν ἐκάστων τοῦσας ὁ 10 θεὸς ἔθηκεν εἰς τὰς περιφοράς, ἂς ἡ θατέρου περιόδος ἤμεν, ἔπτα οὖσας ὅντα ἔπτα, σελήνη μὲν εἰς τὸν περὶ γῆν πρῶτον, ἦλιον δ’ εἰς τὸν δεύτερον ὕπερ γῆς, ἐωσφόρον δὲ καὶ τὸν ἰερὸν Ἡρμοῦ λεγόμενον εἰς τοὺς τάχει μὲν ἴσοδρομον ἥλιον κύκλου ἴσως,

3 διαιωνίας: αἰωνία S. 8 πλανήτα: πλανητά S.

13 τοὺς: τὸν ΛΗΖ.

For night and day are measured by the revolution of the universe, and months and years by the moon and the sun; and all the other planets give measures of time, diverse and manifold, though they are not accounted such by the multitude: and the perfect year is fulfilled when all the revolutions come round at the same time to the same point. For these causes were the heavenly bodies created.

1. μετ’ οὐρανοῦ γέγονεν] ‘has come into being in our story’, as the tense denotes. Time and the material universe are of necessity strictly coeval, since each implies the other nor can exist apart from it.

2. ἐν ποτε λύσι] Proklos has some sensible remarks on this passage, saying σαφῶς ἀγέννητον καὶ ἀφάρπατον δείκνυον τὸν οὐρανον. εἰ γὰρ γέγονεν, ἐν χρόνῳ γέγονεν. εἰ δὲ μετὰ χρόνου γέγονεν, οὐκ ἐν χρόνῳ γέγονεν· οὐδὲ γὰρ ὁ χρόνος ἐν χρόνῳ γέγονεν, ἦν μὴ πρὸ χρόνον χρόνος. εἰ ἀρὰ μετὰ χρόνου γέγονεν, οὐ γέγονεν. δὲ γὰρ πάντα τὸ γεγονόμενον μεταγενέστερον εἶναι χρόνον· ὅ δ’ οὐρανὸς οὐδαμῶς ἐστὶ χρόνου μεταγενέστερον...διόπιον οὖν ὡς εἰ τις περιττὰς εἶναι βουλόμενος τὰς θατέρου περιφορὰς ἐπτάδαλέγοι συμπάρχειν αὐταῖς.
XI. Time then has come into being along with the universe, that being generated together, together they may be dissolved, should a dissolution of them ever come to pass; and it was made after the pattern of the eternal nature, that it might be as like to it as was possible. For the pattern is existent for all eternity; but the copy has been and is and shall be throughout all time continually. So then this was the plan and intent of God for the generation of time; the sun and the moon and five other stars which have the name of planets have been created for defining and preserving the numbers of time. And when God had made their several bodies, he set them in the orbits wherein the revolution of the Other was moving, in seven circles seven stars. The moon he placed in that nearest the earth, and in the second above the earth he set the sun; and the morning-star and that which is held sacred to Hermes he assigned to those that moved in an orbit having equal speed with the sun,

12. ἐωσφόρον] i.e. Venus. Plato was aware of the identity of ἐωσφόρος and ἐσπερός. It is somewhat strange that he gives none of the planets their usual appellations except Mercury; for these names must have been current in his day: they are all given in Epinomis 987 b, c. Other Greek names were for Saturn φαλάνων, for Jupiter φαθέων, for Mars πυρώς, for Mercury στιλβων, while Venus was φωσφόρος, ἐωσφόρος, or ἐσπερός: see Cicero de natura deorum II §§ 52, 53; pseudo-Aristotle de mundo 392 a 23.

13. εἰς τοὺς τάχει μὴ ἵσοδρομον] I have with Stallbaum adopted τοὺς. The reading τῶν, which has best authority, can nevertheless hardly be right, since it would imply that Venus and Mercury had one and the same orbit. It may be objected that, if κύκλους is to be supplied, we have an awkward tautology in κύκλους κύκλων ἴσων. But may we not understand πλανῆται? As to the equality of the periods assigned to the Sun, Venus, and Mercury, compare Republic 617 b
Plato’s observation do not in the slightest degree lend themselves to such a hypothesis. Martin gives the following statement of the facts which it is supposed the contrary motion is intended to explain. After the conjunction of either Venus or Mercury with the sun at perigee, for some time the planet gains upon the sun; then for several days it is nearly stationary in relation to him; after which it begins to lose ground, comes into conjunction with the sun at apogee, continues for some time longer to lose ground, and then again appears stationary: once more it begins to gain on the sun, comes into conjunction at perigee, and so forth ad infinitum.

Now, as Martin observes, the theory of
but having a contrary tendency: wherefore the sun and Hermes and the morning star in like manner overtake and are overtaken one by another. And as to the rest, were we to set forth all the orbits wherein he put them and the causes wherefore he did so, the account, though only by the way, would lay on us a heavier task than that which was our chief object in giving it. These things perhaps may hereafter, when we have leisure, find a fitting exposition.

contrary motion is flagrantly inadequate to account for these facts; for since the motion of the planets will thus be approximately in the same direction as the motion of the Same, they would regularly and rapidly gain upon the sun. The truth is, as I believe, that Plato meant the sun to share the contrary motion of Venus and Mercury in relation to the other four planets. It is quite natural, seeing that the sun and the orbits of Venus and Mercury are encircled by the orbit of the earth, while Plato supposed them all to revolve about the earth, that he should class them together apart from the four whose orbits really do encircle that of the earth: his observations would very readily lead him to attributing to these three a motion contrary to the rest; but there seems nothing which could possibly have induced him to class the sun apart from the two inferior planets. But if this is so, what is the ἐνάργτια διώνεως? What I believe it to be may be understood from the accompanying figure, which is copied from part of a diagram in Arago's *Popular Astronomy*. This represents the motion of Venus relative to the earth during one year, as observed in 1713. It will be seen that the planet pursues her path among the stars pretty steadily from January to May; after that she wavers, begins a retrograde movement, and then once more resumes her old course, thus forming a loop, which is traversed from May to August. After that she proceeds unaltering on her way for the rest of the year. This process is repeated so that five such loops are formed in eight years. Mercury behaves in precisely the same way, except that his curve is very much more complex and the loops occur at far shorter intervals. Now this is just what I believe is the ἐνάργτια διώνεως, this tendency on the part of Venus, as viewed from the earth, periodically to retrace her steps. These retrogressions of the planets were well known to the Greek astronomers, who invented a complex theory of revolving spheres to account for them. Probably Plato meant to put forward no very definite astronomical theory: for instance he gives no hint of the revolving spheres: he merely records the fact of this retrogressive tendency being observable.

If the contrary motion of the two planets is insisted on, the result follows that we have here the one theory in the whole dialogue which is manifestly and flagrantly inadequate. Plato's physical theories, however far they may differ from the conclusions of modern science, usually offer a fair and reasonable explanation of such facts as were known to him: they are sometimes singularly felicitous, and never absurd. I cannot then believe that he has here presented us with a hypothesis so obviously futile. And if he had, how did it escape the vigilance of Aristotle, who would have been ready enough to seize the occasion of making a telling point against Plato?

It is remarkable that neither in *Republic* 617 A, nor in *Epinomis* 986 ε (the author of which must have been well acquainted with Plato’s astronomy), nor
yet in the pseudo-Timaeus Locrus, who has a rather minute paraphrase of the present passage, is there mention of a contrary motion as belonging to any of the planets.

4. 

This correction is absolutely necessary. The circle of the Other passes 

the point of the equator, and is controlled by it, that is, it is carried round as a whole by the rotation of the Same. The relative motion of the Same and the Other are precisely exemplified, if we suppose an ordinary terrestrial globe to be revolving on its own axis, and a point upon its surface traversing it along the circle of the ecliptic in a direction approximately contrary to the globe’s rotation: thus the point, while retaining its own independent motion on the surface of the globe, shares the rotary motion of the whole. Lindau would justify 

by treating it as a genitive absolute referring to the point of the equator: but this is hopeless.

5. 

Thus the periods of revolution continuously increase from the Moon to Saturn. Böckh has sufficiently demonstrated that the words 

and do not refer to the absolute velocity of the planets through space, but to the celerity with which they accomplish their revolutions: thus the moon, having the smallest orbit to traverse, completes it in by far the shortest period; although her actual velocity may be much less than that of Saturn who has the largest orbit and the longest period. Thus the Sun, Venus, and Mercury, having the same period for 

, differ in actual velocity in the proportion 2, 3, 4.

6. 

The difficult passage which follows has been very lucidly expounded by Böckh in his invaluable essay ‘Ueber das kosmische System des Platon’ pp. 38—48. Martin’s note also is excellent: of Stallbaum’s the less said the better. The two chief points requiring explanation are the apparent overtaking of the swifter planets by the slower, and the formation of the spirals. To take the former first, the sentence 

is explained by the following 

Let the circle represent the universe, diurnally rotating from east to west on its own axis, which is perpendicular to the plane of the equator. The representation being in two dimensions, the straight lines must be taken to indicate great circles of a sphere. Thus the motion of the Same is in the direction . The motion of the Other, or of the planets, is in the direction . Let us suppose two planets to be at a given time at the point . Now had these planets, which we
But when each of the beings which were to join in creating time had arrived in its proper orbit, and had been generated as animate creatures, their bodies secured with living bonds, and had learnt their appointed task; then in the motion of the Other, which was slanting and crossed the motion of the Same and was thereby controlled, whereas one of these planets had a larger, another a smaller circuit, the lesser orbit was completed more swiftly, the larger more slowly: but because of the motion of the Same those which revolved most swiftly seemed to be overtaken by those that went more slowly, though really they overtook them. For the motion of the Same, twisting all their circles into spirals, because they have a separate and simul-

will call \( P^3 \) and \( P^4 \), no independent motion of their own, but were stationary relatively to the universe, it is obvious that in twenty-four hours the revolution of the Same would bring them both round to the same point \( E \). But suppose that \( P^2 \) travels twice as fast as \( P^3 \) (that is accomplishes twice as great a fraction of its own orbit in the same time): then, while during the day \( P^3 \) has arrived at \( F \), \( P^2 \) has got as far as \( G \). Thus, since the course of the planets is approximately opposite to the rotation of the whole, \( P^2 \) has counteracted that motion to twice as great an extent as \( P^4 \), and accordingly is proportionally longer in being carried back opposite \( E \). Thus \( P^4 \), departing more slowly from the revolution of the Same (\( \beta\rho\alpha\delta\omega\tau\alpha\alpha \\dot{a} \pi\iota\dot{a} \ \dot{a} \tau \ \alpha\nu\tau\iota\dot{\eta} \), arrives at the same region of the heavens earlier than \( P^3 \), and so seems to the popular eye to have outstripped it. The revolution of the Same being immeasurably the swiftest, it is the motion imparted by this which attracts the eye from day to day; and when the leeway due to the planet's own motion is made up, the slower planet appears faster because it accomplishes the rotation of the Same in the shorter time. Supposing for instance on a given day the moon rises as the sun sets, on the following day the moon will not rise for perhaps an hour after sunset, thus appearing to have lost an hour on the sun.

9. \( \sigma\tau\rho\dot{e} \phi\omega\nu\alpha \ \dot{\alpha} \dot{\iota} \kappa \alpha \) The motion of the Same produces the spirals as follows. In the foregoing diagram we will suppose a planet at a given time to be at the point \( E \). Now, as before said, were the planet itself stationary, this diurnal revolution would in twenty-four hours bring it round again to the point \( E \); and the figure described by the planet would be a perfect circle. But, as it is, while the motion of the Same is whirling it round, the planet is travelling along its own path towards \( G \). At the end of twenty-four hours then the planet is not at \( E \) but at \( G \); and the figure it has described under the influence of the motion of the Same is accordingly not a circle but a spiral. Similarly the next diurnal revolution brings it back not to \( G \), but to a point between \( G \) and \( D \); so that each daily journey of the planet caused by the revolution of the Same is
a spiral. This of course in no wise affects its own proper movement along the circle of the Other.

It is necessary to bear clearly in mind that the apparent overtaking of the swifter by the slower planets has nothing to do with the spirals. The spirals are due solely to the obliquity of the ecliptic. But if there were no such obliquity, if the motion of the Other were directly opposed to that of the Same, the illusion concerning the swifter and slower planets would be unaltered. In that case $P^4$ and $P^2$, instead of travelling to $F$ and $G$, would travel to points on $EA$ equidistant with $F$ and $G$ from $E$. In this case no spirals would arise; the planets would all in good time get back to $E$; but $P^4$ would equally appear to have outstripped $P^2$.

A few words must be said concerning the construction, which is not quite free from obscurity. I agree with Böckh in joining διὰ τὸ διὰχ tâmα not with the preceding clause, but not in taking τὸν κόλπον as the subject; for then it is hardly possible to give a suitable sense to διὰχ. But if we regard τὴν θατερίου φορὰν and τὴν ταύτα jointly as the subject of προέβαιν we are enabled to do so. The spirals are formed because the circles move διὰχ, that is, separately, asunder i.e. they are not two contrary motions in the same circle, but two approximately contrary motions in two separate intersecting circles. κατὰ τάνατν does not constitute any part of the cause why the spirals are formed; they would arise equally well the motion of the Other from $D$ to $C$; but Plato is in fact condensing into this one clause a statement of how the spirals are formed and how the slower planets seem to overtake the swifter: the first is given by διὰχ, the second by κατὰ τάνατν. The difficulty of the passage mainly arises from this extreme brevity.

3. καθ᾽ α] I have ventured upon this correction of the ms. reading καὶ τὰ, which certainly cannot stand, involving as it does the absurd conception that the hea-
taneous motion in the opposite way, being of all the swiftest displays closest to itself that which departs most slowly from it. And that there might be some clear measure of the relative swiftness and slowness with which they moved in their eight revolutions, God kindled a light in the second orbit from the earth, which we now have named the sun, in order that it might shine most brightly to the ends of heaven, and that living things, so many as was meet, should possess number, learning it from the motion of the same and uniform. Night then and day have been created in this manner and for these causes; and this is one revolution of the undivided and most intelligent circuit; and a month is fulfilled when the moon, after completing her own orbit, overtakes the sun; a year, when the sun has completed his own course. But the courses of the others men have not taken into account, save a few out of many; and they neither give them names nor measure them against one another, comparing them by means of numbers—nay I may say they do not know that time arises from the wanderings of these, which are incalculable in multitude and marvellously intricate. None the less however can we observe that the perfect number of time fulfils the perfect year at the moment

venly bodies could not see their way until their orbits were illumined by the Sun.

6. μαθώντα παρὰ τῆς ταυτοῦ] Day and night are caused by the diurnal rotation of the universe, which is the motion of the Same, round the earth: and these, being smaller than any other divisions of time produced by the celestial bodies, are taken as the unit of measurement. Hence man derived the conception of number: compare 47 A, and Epinomis 978 c foll.

8. ἡ τῆς μασῖ] The circle of the Same, it will be remembered, was left ἀσχιστός. The περιοδός is here put for the time consumed in completing the περιοδός, the νυχθέμερον, as Proklos calls it.

10. ἐκλεν ἐπικαταλάβῃ] i.e. the synodical month of $39\frac{1}{2}$ days; the sidereal month, or period in which the moon completes her own circuit, being about $27\frac{1}{2}$.

14. οὐκ ἔσον ξρόνον δύνα] Plato means that men have not generalised concerning time: they do not reflect that the revolutions of the other celestial bodies equally afford measurements of time.

17. τὸν τέλεον ἑναυτοῦ] The perfect year is when all the planets return to one and the same region of the heavens at the same time. See Stobaeus ecl. 1 264. σχῆ κεφαλῆ, 'attain their starting-point'; as Stobaeus l.l. puts it, ὅταν ἐπὶ τοὺς ἀφ' ἥξαντο τῆς κυκλήσεως ἀφικνώνται τόπους. Alkinoos also says that the perfect number is complete when all the planets arrive in the same sign of the zodiac and are so situate that a radius drawn from the earth to the sphere of the fixed stars passes through the centres of all. The phrase σχῆ κεφαλῆ seems like a technical term of astronomy, but I have found no other example of it, though Stobaeus speaks of a κεφαλῆ Κρόνου. As to the duration of the μέγας ἑναυτὸς there is no agreement among the ancients. Tacitus dial. de orat. 16 gives
it on the authority of Cicero at 1954 years; but Cicero himself, de natura deorum ii § 52, expresses no opinion.

1. τὰ πρὸς ἄλληλα ἔμμπερανθέντα τάχην] i.e. when their several periods are accomplished simultaneously: τάχη of course refers to the period of ἀποκατάστασις, not to the actual velocity.

2. τῶ ταυτοῖ] Because the periods are measured by the number of days and nights they contain.

39 E—40 D, c. xii. Next God created four kinds of living creatures in the universe, so many forms as he saw there were in the type. One, the race of the heavenly gods, he fashioned for the most part of fire; the second soared in the air; the third dwelt in the waters; and the fourth went upon dry land. The gods, who are the stars of heaven, he placed in the sphere of the Same to follow its revolution, so many of them as are fixed stars; and he gave them two motions, one a uniform rotation on their own axis, the other a forward revolution about the centre of the universe; but in the other five motions they had no part. The planets he set, as aforesaid, in the sphere of the Other. But the earth he made motionless at the centre, fast about the axis of the universe, to be the measure of day and night, first and most august of divine beings. Now all the motions of these stars and their crossings and conjunctions and occultations it were vain to describe without an orrery: let this account of them suffice.

11. τοιαύτας καὶ τοιαύταις] The influence of οἶαι τῇ καὶ δόσαι preceding has caused these words to be substituted for ταύτης, which would regularly correspond to ἥπερ.

13. οὐράνιοι θεῶν γένος] i.e. the stars and planets. The γένη are four in number.
when the relative swiftnesses of all the eight revolutions accomplish their course together and reach their starting-point, being measured by the circle of the same and uniformly moving. In this way then and for these causes were created all such of the stars as wander through the heavens and turn about therein, in order that this universe may be most like to the perfect and ideal animal by its assimilation to the eternal being.

XII. Now up to the generation of time all else had been accomplished in the likeness of that whereunto it was likened: but in that it did not yet contain all living creatures created within it, herein it was still unlike. So he went on to complete this that remained unfinished, moulding it after the nature of the pattern. So many forms then as Mind perceived to exist in the ideal animal, according to their variety and multitude, such kinds and such a number did he think fit that this universe should possess. These are fourfold: first the race of the heavenly gods, next the winged tribe whose path is in the air, third whatso dwells in the water, and fourth that which goes upon dry land. The visible form of the deities he created chiefly of fire, that it might be most radiant and most fair to behold; and likening it to the All he shaped it like a sphere and assigned it to the intelligence of the supreme to follow after it; and he disposed it throughout all the firmament of heaven, to be an adornment of it in very truth, wrought cunningly over the whole expanse. And he bestowed two movements upon to correspond with the four elements. It is to be observed that only in the first class does the correspondence depend upon the structure: the remaining three are classed according to their place of abode.

15. τὴν πλείστην ἱδέαν] cf. Epinomis 981 D τὸ γὰρ πλεῖστον πυρὸς ἔχει, ἔχει μὴν γῆς τε καὶ ἄλος, ἔχει δὲ καὶ ἀπάντων τῶν ἄλον βραχεῖα μέρη. The reason for the qualification is doubtful that were they constituted solely of fire, they would be ὑπατά, but not ἀπάτα: some admixture of earth was necessary to give them the second distinctive property of bodily existence; cf. 31 B.

ἀπευράξετο] This reading, which is that of all mss. except A, seems certainly preferable to ἀπὴρξατο—an entirely inappropriate word. I cannot think that the authority of A ought to prevail to the exclusion of sense.

17. ἐς τὴν τοῦ κράτιστου φρόνημαν] A very bold substitute for ἐς τὴν τοῦ κρατίστου περιφοράν φρονιμωτάτην ὀδόν. τὸ κράτιστον evidently signifies the Same, cf. 36 C; and the phrase means that the fixed stars, situate in the outermost sphere, follow the diurnal rotation of the universe, but do not change their positions relative to it.

18. κόσμου ἀληθινον] The play on the word κόσμος is obvious, though hardly capable of being retained in translation.
I. τὴν μὲν ἐν ταύτῳ] No more is meant than that rotation upon an axis, being of all motions the most uniform, is the best symbol of the unerring uniformity pertaining to the activity of pure reason. The stars then, being the highest of finite intelligences, naturally have this motion. A curious instance of false conclusion from a true premiss is to be found in Aristotle de caelo ii viii 290 a 25, where the rotation of the heavenly bodies is denied on the ground that the same side of the moon is always turned towards us.

2. ὑπὸ τῆς ταύτου] i.e. the motion εἰς τὸ πρόσθεν is not an advance in a straight line, but by the revolution of the Same is formed into a circular orbit.

7. τρεπόμενα] sc. τροπᾶς ἐχοντα, as above, 39 D.

8. ἐν τοῖς πρόσθεν] 38 C foll.: καὶ ἐκάνα is merely antecedent to καθάπερ.

9. ἐλλομένην δὲ περὶ τὸν διὰ παντὸς πόλον] For an exhaustive and very masterly examination of this passage see Böckh’s essay ‘Über das kosmische System des Platon’. Böckh has proved beyond all controversy that Plato does not here affirm the rotation of the earth upon her axis. Grote has indeed attempted to reply to his arguments, but only to meet with a crushing refutation: see Böckh’s ‘Kleine Schriften’ vol. iii p. 294 foll. It is indeed evident from one consideration alone that Plato cannot have intended the earth to move. The universe, he says, revolves diurnally on its axis, and thus, by carrying the sun round with its revolution, causes the alternation of day and night on any given region of the earth once in 24 hours. Now if the earth had an independent revolution of her own, whether in the same or in a contrary direction, it is self-evident that this whole arrangement would be overthrown: if the theory is to account for the phenomena, the earth must be absolutely motionless.

The word ἐλλεσθάι, ἐλείσθαι, or ἐλεσθάι, though it does not necessarily exclude the idea of motion, in itself in no wise implies it. Its signification is forcible compression or conglabation: the earth is packed or balled round the centre. Cicero’s translation is ‘quae traiecto axe sustinetur’. Various forms of the word are extremely common in Homer to express the dense packing of a crowd of men: e.g. Iliad viii 215. In passages where the meaning is extended to include motion, such as Sophokles Antigone 340 ἐλλομένων ἀρτρῶν ἔτος εἰς ἔτος, the real force of the word lies, not in the motion, but in the confinement of the motion within certain restricted limits, as is justly pointed out by Prof. Campbell, who says ‘the force of ἐλλειπὼς is “limited motion”’. It is indeed safe to affirm that no controversy would ever have arisen on the subject, but for a passage in Aristotle, de caelo ii xiii 29 b 30. In the Berlin text this reads as follows: ἐνοι δὲ καὶ κειμένην
each, one in the same spot and uniform, whereby it should be ever constant to its own thoughts concerning the same thing; the other forward, but controlled by the revolution of the same and uniform: but for the other five movements he made it motionless and still, that each star might attain the highest completeness of perfection. From which cause have been created all the stars that wander not but abide fast for ever, living beings divine and eternal and in one spot revolving: while those that move in a circle and wander as aforesaid have come into being on those principles which in the foregoing we have declared.

And the earth our foster-mother, that is globed round the axis stretched from pole to pole of the universe, her he fashioned

έπι τοῦ κέντρου φασιν αὐτὴν Ἡλεσθαὶ περὶ τῶν διὰ παντὸς τεταμένου πόλου, ἵστερ ἐν τῷ Τίμαιῳ γέγραπται. This (except that for Ἡλεσθαἱ they give εἰλεσθαὶ) is the reading of two mss.; three others add καὶ κυνείσθαι. Thus there arise three ἀπορίαι: (1) are the words καὶ κυνείσθαι, which Simplicius had in his text, genuine? (2) has Aristotle misstated Plato’s view? (3) if we admit καὶ κυνείσθαι, can the passage be so understood as to harmonise with Plato’s statement? Böckh, adopting the third hypothesis, interprets Aristotle thus: φασιν αὐτὴν “Ἑλεσθαὶ” καὶ κυνείσθαι “περὶ τῶν διὰ παντὸς τεταμένον πόλον”. That is, he supposes Aristotle to be stating, not Plato’s view, but that of some who conceived the earth to rotate, quoting the words of the Τίμαιος, but adding καὶ κυνείσθαι to adapt them to his present purpose. This however is perhaps too ingenious. As for the second alternative, we have seen and have yet to see that Aristotle has repeatedly misrepresented Plato; and if he was here citing the Τίμαιος from memory, it is impossible to say that he may not have done so in the present instance. On the whole however I am disposed to believe that the words καὶ κυνείσθαι were added by some unwise annotator, who had in his mind the sentence which occurs soon afterwards.

26ος 26 ο’ ἐπὶ τοῦ μέσου θέτες Ἡλεσθαὶ καὶ κυνείσθαι φασι: where the added words distinguish the theory there stated from Plato’s.

One argument of Grote’s may briefly be noticed. The inconsistency, he says, between the rotation of the earth on her axis and the diurnal rotation of the universe escaped Aristotle (since he does not advert to it), why then should it not have escaped Plato? But Aristotle is not criticising the cosmogony of the Τίμαιος, but discussing the mobility of the earth; therefore he is not concerned to notice such an inconsistency: moreover Grote is herein guilty of petītio principii respecting Aristotle’s text. But it is really supererogatory to expose the weakness of a hypothesis which has reduced so able a reasoner as Grote, in his eagerness to convict Plato of an irrationality, to insist on importing the ἀτράκτος from the mythical imagery of Republic x into the serious cosmology of the Τίμαιος, to serve as a solid axis of the universe. Plato was never guilty of such an absurdity as to conceive the axis as other than a mathematical line. If we are to find a place in the Τίμαιος for the ἀτράκτος, why not also for the σφόνδυλοι, for the knees of Necessity, in short for the whole apparatus of the myth?
It may be asked, must not the earth, having a soul, possess motion, seeing that all the other heavenly bodies move because they are ἐνέφυσόντες? To this Martin acutely replies that, had she not a soul of her own, she must rotate on her own axis (which is part of the axis of the universe), following the rotation of the whole. But her vital force enables her to resist this rotation, and by remaining fixed to measure day and night: her rest in fact is equivalent to a motion countervailing the motion of the whole.

1. φύλακα καὶ δημιουργῶν] Earth is the "guardian" of day and night inasmuch as without her they could not be measured; the "creatrix", because it is her shadow which causes night to be distinct from day. Proklos says μᾶλλον μὴν ὁ μὲν ἂν ἡμέρας, ἢ δὲ νυκτὸς αἰτία. But day, regarded as the light portion of the νυκτὸς ἡμέρα, cannot exist unless night exists wherewith to contrast it; therefore in that sense earth is its δημιουργὸς: without her there would be light, but not day. Martin puts it thus: "[elle] est ainsi la productrice du jour par sa résistance au mouvement, en même temps qu'elle en est la gardienne par son immobilité".

2. ὅσοι ἐντὸς οὐρανοῦ] i.e. she is inferior only to the οὐρανός as a whole.

3. χορεῖας] This is an astronomical term signifying the revolution of the planets around a common centre, as it were in a round dance: see Ερινομίς 982 e πορελάν δὲ καὶ χορείαν πάντων χορῶν καλλιτην καὶ μεγαλοπρεπετάτην χορεύοντα. παραβολή is explained by Proklos to denote the position of two planets in the same longitude, though different latitude, or their rising or setting simultaneously: παραβολάς δὲ τὰς κατὰ μήκος ἀὐτῶν συντάξεις, ὅταν κατὰ πλάτος διαφέρουσιν, ἢ κατὰ βάθος, τὰς συνανατολάς λέγω καὶ συγκατάσεις.

καὶ <τὰ> περὶ τὰς] The vulgar καὶ περὶ τὰς cannot be right, nor is the conjecture of Stephanus, περιτάς, much more satisfactory than Stallbaum's ποικίλας. Acting on a suggestion of the Engelmann translator I have inserted τὰ, which at least gives a good sense. From Ρωμαία Πτύρον δὲ φορὰ ἐνα, ὡς σφίξει φανερεία, ἐπανακυκλωμένων τῶν τέταρτων we might infer that ἐπανακυκλώσει simply means the planet's ἀποκατάστασις: the "return of the circle upon itself" denoting the revolution of the περιφορὰ again to a given point. If Proklos is to be trusted however, it means the retardation of one heavenly body in relation to another, as προσχώρησις means the gaining by one upon another. For προσχώρησις it is probable that we ought to read προσχωρείς, which is given by one ms.

5. ἐν τε ταῖς ἐξυνάψεσιν] This sentence is certainly complex and involved, but I see no sufficient reason for meddling
to be the guardian and creator of night and day, the first and most august of the gods that have been created within the heavens. But the circlings of them and their crossings one of another, and the manner of the returning of their orbits upon themselves and their approximations, and which of the deities meet in their conjunctions and which are in opposition, and how they pass before and behind each other, and at what times they are hidden from us and again reappearing send to them who cannot calculate their motions panics and portents of things to come—to declare all this without visible illustrations of their

with the text. The chief causes of offence are (1) the repeated interrogative μεθ’ οὐστινας—οὐστινας, (2) the position of τε after ἦμων. Stallbaum would read κατὰ χρόνους τινάς. I think however that the ms. reading may be defended as a double indirect interrogative: a construction which, though by far less common than the double direct interrogation, is yet quite a good one: cf. Sophokles Antigone 1341 οὐδ’ ἔχω διὰ πρὸς πότερον ἴδω. The literal rendering of the clause will then be ‘behind what stars at what times they pass before one another and are now severally hidden from us, now again reappearing &c.’ The τε after ἦμων really belongs to κατακρύπτονται and is answered by the following καὶ, quasi ἦμων...κατακρύπτονται τε καὶ ἀναφανώμενοι...πέμπονται. For the irregular position of τε compare Thukydides IV 115 οἱ δὲ Ἀθηναῖοι ἠμύναντό τε ἐκ φαύλου τειχισμάτος καὶ ἄπ’ οἰκίων ἐπάλξεις ἔχουσών. And instances might be multiplied. So much for the main difficulties: there remain a few lesser points. εν τε ταῖς ἔνναψεν (ἐνναψις is in technical language ‘conjunction’) must of course be taken with κατ’ ἀλλήλους γιγανόμενοι alone: δοὺς καταστικοῦ denotes the contrary situation, ‘opposition’. γιγανόμενοι must be supplied with δοὺς καταστικό, and again with μεθ’ οὐστινας τε ἐπιπροσθέν ἀλλήλους: i.e. when a given star passes behind a second and before a third. The whole sentence, as I read it, is undeniably a very complicated piece of syntax; and it is possible enough that some mischief may have befallen the text; but I have seen no emendation convincing enough to warrant me in deserting the mss. And it should be remembered that the Timaeus contains much more of involved construction than the earlier dialogues in general do. With μεθ’ οὐστινας is to be understood τῶν θεῶν.

9. τοῖς οὖ δυναμενοῖς] Although the negative rests on the authority of Δ alone, I have yet retained it, understanding the sense to be that the celestial movements are held for signs and portents by those who do not comprehend the natural laws which govern them. The οὐ would very readily be omitted by a copyist living at a time when astrology had become prevalent, and recourse was had to the professional astrologer for interpretation of the signs of the heavens. If it be objected that the negative ought to be μή, I should reply that this is one of many cases where the negative coheres so closely with the participle as practically to form one word: cf. Isokrates de pace § 13 νομίζετε δημοτικότερον εἶναι τοὺς μεθύνοντας τῶν νησίων καὶ τοὺς νότιος οὐκ ἔχοντας τῶν εἰς φρονούντων. There νοῦν οὐκ ἔχοντας = ἀνοίγος, as here οὖ δυναμενοῖς = ἀδινατοῦσαν.
ἀνευ <τῶν> δὲ ὅψεως τούτων αὐτῶν μυμημάτων μάταιος ἄν εἴη πόνος: ἀλλὰ ταυτά τε ἵκανός ἥμιν ταύτη καὶ τὰ περὶ θεῶν ὀρατῶν καὶ γεννυτῶν εἰρήμενα φύσεως ἐχέτω τέλος.

XIII. Περὶ δὲ τῶν ἄλλων δαμιόνων εἰσεῖν καὶ γνώναι τὴν ἕνεσιν μείζον ἡ καθ' ἡμᾶς, πειστέον δὲ τοῖς ἑρημώτως ἐμπροσθεν, ἐκγνώσει μὲν θεῶν οὐσία, ὃς ἐφασαν, σαφὸς δὲ ποι τοὺς τε αὐτῶν προγόνους εἰδόσεις ἀδύνατον οὐν θεῶν παίσιν ἀποστείω, καίστερ Ε ἀνευ τε εἰκότων καὶ ἀναγκαῖων ἀποδείξεων λέξουσι, ἀλλ' ὁς οἰκεία φασκόντων ἀπαγγέλλειν ἐπομένους τῷ νόμῳ πιστευτέον.

10 οὕτως οὖν κατ' ἐκείνους ήμῖν ἡ γένεσις περὶ τούτων των θεῶν ἐχέτω καὶ λεγέσθω. Γῆς τε καὶ Οὐράνου παῖΔες Ὡκεανὸς τε καὶ Τηθύς ἐγενέσθην, τοῦτον δὲ Φώκυς Κρόνος τε καὶ Ἑρά καὶ ὁσοι μετὰ τούτων, ἐκ δὲ Κρόνου καὶ Ἡρας Ζεὺς 'Ἡρα τε καὶ 41 Α πάντες ὅσους ἰσμεν ἀδελφοὺς λεγομένους αὐτῶν, ἔτι τε τούτων

15 ἄλλους ἔκγνωσι.

Ἐπεὶ δ' οὖν πάντες, ὅσοι τε περιπολοῦσι φανερῶς καὶ ὁσοι φαίνονται καθ' ὅσον ἄν ἐθέλοσιν, οἱ θεοὶ γένεσιν ἔσχον, λέγει πρὸς αὐτοὺς ὅ τόδε το πᾶν γεννήσας τάδε: Θεοὶ θεῶν, ὃν ἐγὼ

1 ἀνευ τῶν δι' ὅψεως scripsi auctore Proclo. ἀνευ διψεως AHSZ. αὐτῶν scripsi. αδ τῶν AHSZ. 4 δαμιόνων: δαμιονῶν Α. 9 φασκόντων: φάσκονων SZ. 17 οἱ θεοὶ: οἱ omitunt SZ.

1. ἀνευ <τῶν > δι' ὅψεως] Proklos, in first citing this passage, gives ἀνευ δι' ὅψεως αὐτῶν τούτων μυμημάτων; presently, quoting it again, he says ἀνευ τῶν δι' ὅψεως, and this I believe to be what Plato wrote. The vulgate ἀνευ διψεως τούτων αὐτῶν μυμημάτων is so uncouth a phrase that it surely cannot have proceeded from him: even the word διψεω itself seems suspicious; it occurs nowhere else before Plutarch. Following the text of Proklos then I construe ἀνευ τῶν δι' ὅψεως μυμημάτων αὐτῶν τούτων—without ocular representations of precisely these things: i.e. without a planetarium to illustrate the movements. Ficinus seems to have read αὐτῶν, to judge from the word 'ipsorum' in his rendering.

6. σαφὸς δὲ τοῦ] The irony of this passage, though it seems to have generally escaped the commentators, is evident; more especially in the opening sentence of the next chapter. Plato had no cause for embroiling himself with popular religion. To his metaphysical scheme it is quite immaterial whether mankind is the highest order of finite intelligences beneath the stars, or whether there exist anthropomorphic beings of superior rank, such as the gods and daemons of the old mythology.

40 D—41 D, c. xiii. Let us then acquiesce in the account given by children of the gods concerning their own lineage and accept the deities of the national mythology. When therefore all the gods of whatsoever nature had come into being, the Artificer addressed the work of his hands, and showed them how that, since they had a beginning, they were not in their own nature immortal altogether, yet should they never suffer dissolution, seeing that the sovereign will of their creator was a firmer
very movements were labour lost. So let thus much suffice on this head and let our exposition concerning the nature of the gods visible and created be brought to an end.

XIII. But concerning the other divinities, to declare and determine their generation were a task too mighty for us: therefore we must trust in those who have revealed it hitherto, seeing that they are offspring, as they said, of gods, and without doubt know their own forefathers. We cannot then mistrust the children of gods, though they speak without probable or inevitable demonstrations; but since they profess to announce what pertains to their own kindred, we must conform to usage and believe them. Let us then accept on their word this account of the generation of these gods. Of Earth and Heaven were born children, Okeanos and Tethys; of these Phorkys and Kronos and Rhea and all their brethren: and of Kronos and Rhea, Zeus and Hera and all whom we know to be called their brothers; and they in their turn had children after them.

Now when all the gods had come to birth, both those who revolve before our eyes and those who reveal themselves in so far as they will, he who begat this universe spake to them these words: Gods of gods, whose creator am I and father of works, which

surety for their endurance than the vital bonds wherewith their being was bound together. But the universe was not yet complete: three kinds of creatures must yet be born, which are mortal. Now if the Artificer created these himself, they must needs be immortal, since he could not will the dissolution of his own work; they must therefore derive their birth from the created gods. Receiving then from him the immortal essence, the gods should implant it in a mortal frame and so generate mortal living creatures, that the universe may be a perfect copy of its type.

Plato indifferently acquiesces in the established custom. His theogony is said by Proklos to be Orphic; it differs from that of Hesiod. For the construction compare 
Those who 'revolve visibly' are of course Plato's own gods, the stars of heaven; the others are the deities of popular belief, who ξείνωσιν ξυκότες ἀλλοδαποῖς, παντοίοι τελέθουσαι, ἐπιστροφώσι πόλισι. There seems again to be a quiet irony in the words φαίνονται καθ' ὅσον ἂν ἑλεθλοῦσιν.

18. θεός θεόν] The exact sense of these words has been much disputed. Setting aside neoplatonic mystifications, which the curious may find in the commentary of Proklos, the interpretations which seem to deserve notice are as follows. (i) 'Gods born of gods'. This, though
supported by Martin as well as Stallbaum, seems to me inadmissible, for the plain reason that the only source whence they derived their birth was the δημιουργός himself; the plural θεῶν then is without propriety or meaning. (2) ‘Gods, images of gods’, cf. τῶν ἄδικων θεῶν γεγονὸς ἄγαλμα. But ‘images’ is not in the Greek, nor can be got out of it: and even granting that it could, the obscure words just quoted are far too unstable a basis for such an interpretation. (3) In my own judgment the phrase is simply an instance of rhetorical δικος, well suited to the stately pomp characterising the whole passage. ‘Gods of gods’ comes nearest, I believe, to the sense of the original, signifying solely the transcendent dignity of the οὐράνιον θεόν, the first-fruits of creation. Superlatives of this kind, though not perhaps common in Greek, certainly exist: compare Sophokles Oed. Col. 1237 ἵνα πρόσαντα κακὰ κακῶν ἔννοικεί: also Oed. Τύχ. 465 ἄρρητη ἄρρητον τελέσαντα φαινόμεν χερόν: Aeschylus Persae 681 ὃ πιστὰ πιστῶν. Plato may have in his mind a comparison between the highest gods and δάμας of a lower rank, such as those of Phaedrus 247 Α or Epinomis 984 Ε: but this is not necessary.

1. οὖν ἐγώ δημιουργός πατήρ τε ἔργων] These words are almost as much debated as the preceding. (1) The clause may be taken in apposition with θεός: see ἔργα, ὃν ἐγώ δημιουργός πατήρ τε: (2) ὁμοίως may be governed by ἔργως, as Stallbaum takes it: (3) or by δημιουργός. It can hardly be doubted that the interpretation is to be preferred which best lends itself to the majestic flow of Plato’s rhythm; and on that ground I should give the preference to the last, making οὖν masculine: ‘whose maker am I and father of works which through me coming into being &c.’ The construction will thus really follow the same principle as the familiar idiom whereby a demonstrative is substituted for the relative in the second member of a relative clause: as for instance in Euthydemus 301 Ε ταύτα Ἰτι σὰ εἶναι, ὃν ἄν ἀρχηγὸς καὶ ἐξή οὐτοῦ χρὴθαι διὶ ἃν βούλῃ.

Badham (on Philebus 30 β) proposes to read the opening clauses thus: θεός, δαμων ἐγὼ δημιουργός πατήρ τε ἔργων, ὅτε δὲ ἐμοὶ γεγονέναι, ἀλτὰ ἐμοὶ γ’ ἐθέλοντος. This is grammatically faultless, but, it is to be feared, sorely inadequate to the ‘large utterance’ of the Artificer. The omission of μη before ἐθέλοντος has the support of most mss. and gives an equally good sense: I retain however the reading of Α, which is confirmed by Cicero’s ‘me invito’.
by me coming into being are indissoluble save by my will: Behold, all which hath been fastened may be loosed, yet to loose that which is well fitted and in good case were the will of an evil one. Wherefore, forasmuch as ye have come into being, immortal ye are not, nor indissoluble altogether; nevertheless shall ye not be loosed nor meet with the doom of death, having found in my will a bond yet mightier and more sovereign than those that ye were bound withal when ye came into being. Now therefore hearken to the word that I declare unto you. Three kinds of mortal beings are yet uncreate. And if these be not created, the heaven will be imperfect; for it will not have within it all kinds of living things; yet these it must have, if it is to be perfect. But if these were created by my hands and from me received their life, they would be equal to gods.

2. τὸ μὲν οὖν δὴ It is impossible not to admire the serenity with which all the editors set a full stop after ἐθέλωντος, and then make a fresh start, as though the words from θεός to ἐθέλωντος were a sentence; as though γιγνησθαι stood in place of γενέμενο. It was easy to convert this into a sentence through milder means than Badham employed, by substituting τὰ for ἃ. But a certain unpleasing curtness is thereby introduced, which leads me to shrink from tampering with the text. I regard then all the words down to ἐθέλωντος as constituting an appellation. The difficulty then arises however, that the particles μὲν οὖν δὴ seem to indicate the commencement of a fresh sentence. Yet the objection is not, I think, fatal: for although the words θεός...ἐθέλωντος are not in form a sentence containing a statement, they do practically convey a statement; and the προστιθησα of being somewhat extended, Plato proceeds as if the information implied in a description were given in the form of a direct assertion. The massive form of the opening address seems to justify a stronger combination of particles at the commencement of the main sentence than could ordinarily be used.

4. οὗ τι μὲν δὴ For this strong adver- sative formula compare Theaetetus 187 A, Philebus 46 B, Phaedrus 259 B; and, without γε, Theaetetus 148 E.

8. γίνη λοιπὰ τρὶς i.e. those which made their habitation in air, in water, and on land.

11. θεοὶ λόγον' ἄν] This assertion of the δημοιργόθα that whatsoever immediately proceeds from him must be immortal is, I think, not without its metaphysical significance. The creation of the universe by the δημοιργόθα, we take it, symbolises the evolution of absolute intelligence into material nature, i.e. into the perceptions of finite intelligences. Now this evolution, the manifestation of supreme thought in the material world, is per se eternal—it is an essential element in the being of eternal thought. But, the evolution once given, the things that belong to it as such are all transitory. Considered as making up the sum total of phenomenal nature, the infinite series of phenomena is eternal: but the phenomena themselves belong not
Mortality is necessary in this way. The scheme of existence involves a material counterpart of the ideal world. To materiality belongs becoming and perishing: accordingly αἰθήτα ζώα, the copies of the νοητά ζώα, must, so far as material, be mortal. Mortality must correspond to immortality as inevitably as multiplicity to unity. Even the stars, which, being the handiwork of the Artificer himself, are immortal, contain within them the processes of γένεσις and φθορά.

κατὰ φύσιν In the way of nature: i.e. βλέποντες πρὸς τὸ ἄλλον. To be mortal is to be a creature of nature.

καθ' ὅσον It has been proposed to omit καθ', but I think the text is sufficiently defended by Stallbaum.

ἀθανάτοις ὁμώνυμοι] The αἰθήτα ζώα are ἀθάνατα, in so far as they possess the indestructible vital essence supplied by the creator; but only ὁμώνυμος, since their present mode of existence as individuals is transitory.

Here seems to be the first suggestion of a word which afterwards became a technical term common in the Stoic philosophy—τὸ ἱγμονοῦν, the reason. We have it again similarly used in 70 c.: cf. Ἄτως 963 Λ νῦν δὲ γε πάντων τούτων ἱγμόνα. The genitive τῶν ἐθελόντων is governed by ἱγμονοῦν.

This transitive use of the middle of this verb is not quoted in Liddell and Scott.

How they did this we learn in 77 A. The gods of course had no need of sustenance; for, like the κόσμος, they αὐτοὶ εαυτῶν τροφὴν τινα ἐαυτῶν φθάνουσαν παρεῖχον. With φθινόντα πάλιν δέχεσθε compare 42 E δαινείζομενοι μόρια ὀς ἀποδοθησόμενα πάλιν: they created mortals out of the substance of the universe, and at their dissolution restored the elements of them thither whence they were borrowed.

Thus having spoken, the Artificer prepared a second blending of soul, having its proportions like to the former, but less pure. And of the soul so formed he separated as many portions as there were stars in heaven, and set a portion in each star, and declared to them the laws of nature: how
Therefore in order that they may be mortal, and that this All may be truly all, turn ye according to nature unto the creation of living things, imitating my power that was put forth in the generation of you. Now such part of them as is worthy to share the name of the immortals, which is called divine and governs in the souls of those that are willing ever to follow after justice and after you, this I, having sown and provided it, will deliver unto you: and ye for the rest, weaving the mortal with the immortal, shall create living beings and bring them to birth, and giving them sustenance shall ye increase them, and when they perish receive them back again.

XIV. Thus spake he; and again into the same bowl wherein he mingled and blended the universal soul he poured what was left of the former, mingling it somewhat after the same manner, yet no longer so pure as before but second and third in pureness. And when he had compounded the whole, he portioned off souls equal in number to the stars and distributed a soul to

that every single soul should be first embodied in human form, clothed in a frame subject to vehement affections and passions. And whoso should conquer these and live righteously, after fulfilling his allotted span, he should return to the star of his affinity and dwell in blessedness; but if he failed thereof, he should pass at death into the form of some lower being, and cease not from such transmigrations until, obeying the reason rather than the passions, he should gradually raise himself again to the first and best form. Then God sowed the souls severally in the different planets, and gave the task of their incarnation to the gods he had created, to make them as fair and perfect as mortal nature may admit.

10. τὰ τῶν πρόσθεν ὑπόλοιπα] Not the remnants of the universal soul, as Stallbaum supposes; for that, we are told in 36 B, was all used up; but of the elements composing soul, ταύτων διάτερον and οὐσία.

11. ἀκήρατα ὀούκτιν] That is to say, the harmonical proportions are less accurate, and the Other is less fully subordinated to the Same: in other words, these souls are a stage further removed from pure thought, a degree more deeply immersed in the material. Compare Philebus 29 b foll. Plato's scheme includes a regular gradation of finite existences, from the glorious intelligence of a star down to the humblest herb of the field: all these are manifestations of the same eternal essence through forms more and more remote.

13. διείλε ψυχὰς ἵσταριμύνοις τοῖς ἄστροις] There is a certain obscurity attending this part of the allegory, which has given rise to much misunderstanding. It is necessary to distinguish clearly between the νομὴ of the present passage and the σφήνα of 42 D. What the δημιουργὸς did, I conceive to be this. Having completed the admixture of soul he divided the whole into portions, assigning one portion to each star. These portions, be it understood, are not particular souls nor aggregates of particular souls: they are divisions of the whole quantity of soul, which is not as yet differentiated into particular souls.
It is hardly necessary to observe that these ψυχαὶ ἵσαριθμοι τῶν ἐστρῶν are quite distinct from the souls of the stars themselves. Next the δημοφυγὸς explains to these still undifferentiated souls the laws of nature; after which he redistributes the whole quantity of soul among the planets (ὅραμα χρόνου, 42 D) for incarnation in mortal bodies. From the language of 42 D, τῶν μὲν...τῶν δὲ, it would seem that the differentiating of the souls into individual beings was done by the δημοφυγὸς himself, before they were handed over to the created gods: in fact this is metaphysically necessary.

Martin’s interpretation appears to me wholly unplatonic, indeed unintelligible. He regards the ψυχαὶ ἵσαριθμοι as distinct from the soul that was afterwards to inform mortal bodies. ‘C’est à ces grandes âmes confiées aux astres, c’est à ces vastes dépôts de substance incorporelle et intelligente, que Dieu révèle ses desseins.’ This he himself most justly terms an ‘étrange doctrine’, and certainly it is not Plato’s. It is surely indubitable that what the δημοφυγὸς mixed in the κρατῆρ was the whole substance of soul intended to be differentiated into particular souls; that this whole substance was first distributed in large portions among the fixed stars, to learn the laws of existence; and that finally it was redistributed among the planets for division into separate souls incorporated in bodies.

But what is the purpose and meaning of this distribution among the fixed stars? I think the explanation is suggested by Phaedrus 253 C, D, where different gods are assigned as patrons for persons of various temperament. The apportionment to diverse stars is thus a fanciful way of accounting for innate diversity of character and disposition; each individual being influenced by the star to which the division was assigned of which what was afterwards his soul formed a part.

1. ὡς ἐς ὀχήμα] The same word is used in 69 D to express the relation of body to soul in the human being, although the relation is different to that here indicated; for these ψυχαὶ do not inform and vitalise the body of the star, which is to them solely a ‘vehicle’.

ἧν τοῦ παντὸς φύσιν ἔδειξε] It is interesting to observe that here in Plato’s maturest period we have something closely resembling the ἀνάμνησις of the Phaedo and Phaedrus. To say that the laws of the universe were declared to soul before it became differentiated into individual souls is very much the same thing as to say that the soul beheld the ideas in a previous existence. At the same
each star, and setting them in the stars as though in a chariot, he shewed them the nature of the universe and declared to them its fated laws; how that the first incarnation should be ordained to be the same for all, that none might suffer disadvantage at his hands; and how they must be sown into the instruments of time, each into that which was met for it, and be born as the most god-fearing of all living creatures; and whereas human nature was twofold, the stronger was that race which should hereafter be called man. When therefore they should be of necessity implanted in bodily forms, and of their bodies something should ever be coming in and other passing away, in the first place they must needs all have innate one and the same faculty of sense, arising from forcible affections; next love mingled with pleasure and pain; and besides these fear and wrath and all the feelings that accompany these and such
time the tendency to merge the individual existence of the soul is characteristic of the Timaeus and of Plato's later thought.

2. γένεσις πρώτη] i.e. their first embodiment in human form. Stallbaum is obviously wrong in understanding by πρώτη γένεσις the distribution among the stars, since the δευτέρα γένεσις is the incarnation εἰς γυμνάκος φύσιν, 42 B. Here however a point presents itself in which the allegory appears πρώτα facie inconsistent. At 39 E Plato says there are four ἐδώ of υψηλά ζῷα in the αὐτῷ ζῷον: yet of ἀληθητὰ ζῷα we only have two ἐδώ at the outset: how then is the sensible world a faithful image of the intelligible world? The answer would seem to be that the δημοφυλγός foresaw that many souls must necessarily degenerate from the πρώτῃ καὶ ἀριστῇ ἐξις, and therefore left the perfect assimilation of the image to the type to be worked out and completed in the course of nature, with which he did not choose arbitrarily to interfere, in order that no soul might start at a disadvantage through his doing: ἵνα μὴ τις ἐφαρμαίνῃ ὑπ' αὑτοῦ. It is remarkable however that the perfection of the copy should be accomplished through a process of degeneration.

4. δεόν δε σπαρείςας] Stallbaum for some incomprehensible reason would insert μετὰ before σπαρείςας. The δημοφυλγός is referring to the στόρος of 42 D, which must take place before the incarnation in mortal bodies can be accomplished. δραμα τρόπων, a phrase recurring in 42 D, the planets: the vulgate τρόπων is clearly a copyist's error. The reason why one planet was more suitable for some souls than another does not appear.

5. ζώον τό θεοσφάτητατον] i.e. mankind: cf. Ἀθηναῖος 902 B ἀμα καὶ θεοσφάτητατον αὐτῷ ἐστὶ πάντων ζώων ἀνθρώπος.

7. ἦς άνάγκης] This phrase expresses the unwilling conjunction of spirit and matter, the reluctance of soul to accept corporeal conditions: cf. 69 D συνεκρα- σμένοι ταῦτα άναγκαίως, and a little above δεινά καὶ άναγκαία παθήμαται ἐν ζωτῷ ἔχων. The whole account in 69 C, D is full of echoes of the present passage.

8. τό μὲν προσαὶ τό δ' ἀπόσι i.e. the body is undergoing a perpetual process of waste and reparation: cf. 43 A ἐνεδόν ἐις ἐπηρρυτον σῶμα καὶ ἐπηρρυτον.

9. βιαλον παθημάτων] I take βιαλον to mean vehement and masterful, though it might be understood like άναγκαία in 69 C.
1. τὸν προσήκοντα χρόνον] No definite period is ordained in the Timaeus, as is the case in the myths of the Phaedrus and Republic.

2. τοῦ ξυνόμου] i.e. the star to which was distributed the portion of soul whence his individual soul afterwards proceeded. συνήθη = congenial: the conditions of life in the σύνομον ἄστρον would be familiar to him, though she was not then differentiated.

4. εἰς γυναικὸς φύσιν] Here, it must be confessed, we have a piece of questionable metaphysic. For the distinction of sex cannot possibly stand on the same footing as the generic differences between various animals; and in the other forms of animal life the distinction is ignored. It is somewhat curious that Plato, who in his views about woman's position was immeasurably in advance of his age, has here yielded to Athenian prejudice so far as to introduce a dissonant element into his theory.

μεταβαλομ] After this word the old editions insert χιλιοστῷ δὲ ἐτεί ἀμφότερας ἀφικνομέναι ἐπὶ κλήρωσιν καὶ αἴρεσιν τοῦ δευτέρου βιοῦ αἱρόωνται ἄν ἄβηλῃ βίων ἐκάστης ἐνθα καὶ εἰς θηλῆς βιῶν ἀνθρωπίνη ψυχὴ ἀφικνεῖται. These words, which stand in the margin of two mss., are simply quoted from Phaedrus 249 B.

5. κατὰ τὴν ὀμοιότητα] That is to say, they assumed the form of those animals to whose natural character they had most assimilated themselves by their special mode of misbehaviour; cf. Phaedo 81 ε ἐνδοῦνται ἐς, ὦσπερ εἰκός, εἰς τοιαῦτα ἢθη ὅποι᾽ ἂτ' ἀν καὶ μεμελετηκύα τοῖς εἰς τῷ βίῳ: and presently we see that the sensual take the form of asses, the cruel and rapacious that of hawks and kites.

8. τῇ ταύτῳ καὶ ὀμοίου περιόδῳ] Even in the lower forms the principle of reason is present, only more or less in abeyance. But once let the soul listen to its dictates, so far as in that condition it can make itself heard, and she may retrieve one step of the lost ground at the next incarnation.

12. ἣν τῇ ἐπειτα] Here as in the Republic Plato absolves God from all responsibility for evil: cf. Republic 379 c oδόν ὅλα ὁ θεός, ἐπειτά ἄγαθος, πάντων ἄν εἰς ἄτιον, ὡς οἱ πολλοὶ λέγουσιν, ἀλλ' ἄλγων μὲν τοῖς ἄνθρωπος αἰτίον, πολλῶν ἄν ἄνετοι πολύ γὰρ ἐλάττω τάγαθα τῶν κακῶν ἡμῶν. καὶ τῶν μὲν ἄγαθῶν οὐδένα
as are of a contrary nature: and should they master these passions, they would live in righteousness; if otherwise, in unrighteousness. And he who lived well throughout his allotted time should be conveyed once more to a habitation in his kindred star, and there should enjoy a blissful and congenial life: but failing of this, he should pass in the second incarnation into the nature of a woman; and if in this condition he still would not turn from the evil of his ways, then, according to the manner of his wickedness, he should ever be changed into the nature of some beast in such form of incarnation as fitted his disposition, and should not rest from the weariness of these transformations, until by following the revolution that is within him of the same and uniform, he should overcome by reason all that burden that afterwards clung around him of fire and water and air and earth, a troublous and senseless mass, and should return once more to the form of his first and best nature.

And when he had ordained all these things for them, to the end that he might be guiltless of all the evil that should be in

Plato declares that evil must inevitably attach? and why is it that evil must arise together with limited existence? To these questions Plato has returned no explicit reply: only we may deduce thus much from his ontological scheme—since the realm of absolute essence is a stable unity, the realm of finite existence is a moving plurality, a process. And if a process, we can only conceive, on Plato's principles, that it is a process towards good. Therefore imperfection must always attach to it, since it is ever approaching but never reaches the good. Were perfection predicable of it, it would be the good—the eternal changeless unity: the two sides of the Platonic antithesis would coalesce; motion and plurality would vanish, and we should relapse into the Eleatic ev which has been proved unworkable. In this sense Plato may say that evil is necessary and that it belongs to matter, not to God. At the same time since the absolute cannot exist without

P. T.
manifesting itself as the finite, and since to the finite belongs evil, the ultimate cause of evil is really carried back to the absolute, though not quia absolute.

2. ὁργανὰ χρόνον] This sowing seems to have been confined to the earth and the seven planets; for these alone appear to be recognised as instruments of time in 39 C, D. It would presumably follow then that to these gods only was committed the formation of the mortal races.

3. τὸ τε ἐπίλουτον] This clearly refers to the θυσίαν ἔλθος ψυχῆς of 69 D; i.e. those functions and activities of the soul which are called into being by her conjunction with matter.

7. αὐτὸ ἐαντῷ] Evil in some shape or other is, as we have seen, an inevitable concomitant of material existence. But if we follow after pure reason, this evil is kept at the lowest minimum; if we perversely forsake her, it is needlessly aggravated. So that while we are not answerable for whatsoever of evil is inseparable from limitation, for all that is the result of our own folly we are answerable. Compare Latuš 904 B τῆς δὲ γενέσεως τοῦ παλῶν τινός ἀφήκε ταῖς βουλήσεως ἐκάστως τὰς αἰτίας δὴν γὰρ ἐπίθυμη καὶ ὁποῖος τις ἦν τὴν ψυχὴν, ταύτῃ σχέσιν ἐκάστοτε καὶ τούτοις γίγνεται ἵππως ἤμων ὧν τὸ πόλον. A further discussion of Plato's position as regards the problem of free will is to be found in note on 86 D.

42 E—44 D, c. xv. And the eternal God was abiding in his own unity. But the created gods, following the example of their creator, fashioned mortal creatures, fettering the motions of the soul in a material body, whereof they borrowed the substance from that of the universe. And the soul, being imprisoned in a body subject to ceaseless inflowing and outflowing, is at first confounded and distracted. For the perpetual stream of nourishment that enters in, together with the bewildering effect of external sensations, throws her into disorder and tumult: the revolution of the Same in her is brought to a stand,
each of them, God sowed some in the earth, some in the moon, and some in the other instruments of time. And what came after the sowing he gave into the hands of the young gods, to mould mortal bodies, and having wrought all the residue of human soul that needed yet to be added, to govern and guide as nobly and perfectly as they could the mortal creature, in so far as it brought not evil upon its own head.

XV. So when he had made all these ordinances for them God was abiding after the manner of his own nature: and as he so abode, the children thinking on the command of their father were obedient to it, and having received the immortal principle of a mortal creature, imitating their own artificer, they borrowed from the universe portions of fire and of earth and of water and of air, on condition that they should be returned again, and they cemented together what they took, not with the indissoluble bonds wherewithal they themselves were held together, but welding it with many rivets, invisible for smallness, and making of all the elements one body for each creature, they confined the revolutions of the immortal soul in a body in-

while that of the Other is distorted or reversed: its harmonic proportions cannot indeed be destroyed, save by the creator alone, but they are in every way strained and perturbed. Accordingly, when she has to judge concerning anything, that it is same or other, her judgment is wrong, and she is filled with falsehood and folly: and reason, which seems to rule, is really enslaved by sensation. For all these causes the soul, at her first entrance into a body, is devoid of reason. But presently, as the disturbance caused by the requirements of nutrition and growth diminishes, the circles of the Same and the Other gradually resume their proper functions, and reason regains her sway. But careful and rational training is requisite in order that a man may enjoy his full intellectual liberty: lacking this, his life will be maimed, and imperfect and unreasonable he will pass beneath the shades.

This chapter supplies a theory to account for the abeyance of reason in infants and young children.

8. ἐγενεν ἐν τῷ έαυτῷ] This phrase is significant. Plato does not say that the θημονυργός returned to his own ἰδός, but that he 'was abiding' therein. The imperfect expresses that not only after he had given these instructions, but previously also, he was abiding. The eternal essence, while manifesting itself in multiplicity, still abides in unity. The process of thought-evolution does not affect the nature of thought as it is in itself: thought, while many and manifold, is one and simple still.

13. ὡς ἀποδοθησόμενα] Plato always insists that the sum of all things, whether spiritual or material, is a constant quantity. Accordingly the gods had to borrow from the store of materials already existing; there could be no addition.

15. τύκνον ἡγομένοι] i.e. the law of cohesion in matter. The word γομφων, as contrasted with δεσμοί, gives the notion of inferior durability.
Plato's Herakleitean theory of matter could hardly find stronger expression than this. Fresh particles are being perpetually added to the body's substance to supply the place of others which are for ever flying off. Compare Theaetetus 159 B foll.

1. ἑπὶ ἄνθρωπον σώμα καὶ ἄπόρρυτον] It may be this expression was suggested by the well-known words of Herakleitos (fr. 41 Bywater) ποταμὸς δις τῶν αὐτῶν οὐκ ἂν ἐμβαίνῃ ἔτερα γὰρ καὶ ἐτέρα ἐπιρρέει ὑδάτα: cf. Cratylus 402 L. According to Aristotle metaph. I ν 1010α 13, Kratylos found this statement not thorough-going enough: Ἡρακλείτων ἐπετίμη εἰσότω ὁτι δις τῷ αὐτῷ ποταμῷ οὐκ ἐστὶν ἐμβηναί· αὐτὸς γὰρ ἄφετο οὐδ' ἀπαξ. Proklos is perhaps right in supposing Plato's ποταμὸς to include not the body only in which the soul resides, but generally the region of γένεσις in which she is placed: ὁ μὲν δὴ ποταμὸς οὐ τὸ ἀνθρώπων ὁ σῶμα συμπαίνει μόνον, ἀλλὰ καὶ πᾶσαν τὴν περικείμενην ἔξωθεν ἡμῶν γένεσιν, διὰ τὴν δὲ ἄφεροντο ἀυτής καὶ ἀδάμημτων ῥοήν.

2. ἑφέροντο καὶ ἔφερον] The periodoi could not be altogether passive, that being impossible for an animate being; the external impressions and the subjective consciousness mutually interacted and conditioned each other.

4. τὰς ἔξω ἀπάσας] These six are reckoned as all for the present purpose, since the seventh, or rotary motion, belongs only to beings of a higher order. It may be noted that a completely different classification of κινήσεως is given in Latus 893 c foll., where 10 kinds are enumerated.

7. πολλοὶ γὰρ ὄντων] Two chief causes are assigned by Plato for the dormant state of the intellect in the case of
flowing and out-flowing continually. And they, being confined in a great river, neither controlled it nor were controlled, but bore and were borne violently to and fro; so that the whole creature moved, but advanced at random without order or method, having all the six motions: for they moved forward and backward and again to right and to left and downward and upward, and in every way went straying in the six directions. For great as was the tide sweeping over them and flowing off which brought them sustenance, a yet greater tumult was caused by the effects of the bodies that struck against them; as when the body of any one came in contact with some alien fire that met it from without, or with solid earth, or with liquid glidings of water, or if he were caught in a tempest of winds borne on the air, and so the motions from all these elements rushing through the body penetrated to the soul. This is in fact the reason why these have all alike been called and still are called sensations (αἰσθήσεις). Then too did they produce the most wide and vehement agitation for the time being, joining with the perpetually streaming current in stirring and violently shaking the revolutions of the soul, so that they altogether hindered the circle of the Same by flowing contrary to it, and they stopped it from governing and from going; while the circle of the Other

infants: the first is the continual influx of nutriment, which the growing child requires; the second and yet more potent cause is the violent effect produced by outward sensations, which bewilder and overwhelm the soul but newly arrived in the world of becoming and inexperienced in its conditions.

10. ἀλλοτρίως περιτυχόν] Plato says 'alien' fire, because, as we learn in 45 B, there is a fire, viz. daylight, which is akin to the fire within our bodies and therefore harmless to us. All the four elements are described, each in its own way, as conspiring to the soul’s confusion. The poetical tone of this passage is very noticeable.

13. ἐν τῇ ψυχῇ] This theory is fully set forth in 64 B foll.: see also Philbus 33 D.

14. διὰ ταῦτα ἐκλήθησαν] What is the etymology intended is not very obvious from the context; but probably, as Martin says, Plato meant to connect ἀλθῆσαι with ἀλᾶσσω. Proklos also proposes the Homeric word ἀλᾶσσω: cf. Plaid XVI 468 ὁ δὲ βράχε ϑυμὸν ἀλᾶσσω: but this suggestion has not very much to recommend it.

16. μετά τοῦ βέντος ἐνδελεχῶς ὄχετοι] i.e. combined with the κῦμα τῆς τροφῆς.

18. παντάπασιν ἐπιθησαν] It should be observed that the effect on the two circles is different: that of the Same is stopped; i.e. the reason does not act: that of the Other is dislocated and distorted; i.e. the reports of the senses are confused and inaccurate.
II.

μεσότητας καὶ συνδέσεις] These words merely signify 'means and connecting links'; they contain no special reference to the λέιμα, as Stallbaum imagines.

3. υπάλληλοι ήδαν] The dissolution of the μεσότητας καὶ συνδέσεις would of course involve the destruction of the soul.

7. αντίλας...πλαγίας...νπτίας] It is not very clear what is the precise import of these terms. Perhaps we may understand the meaning to be that the false report of the senses may be either a negation of the truth, or diverse from it, or contrary to it: e.g. fire is not hot, fire is smoke, fire is cold. So far as the figure is concerned, it would seem impossible to draw any distinction between αντίλας and νπτίας.

10. τὰ τέ δεξία ἀριστερὰ] The nature of this inversion is thus expounded by Proklos. Suppose a man to stand facing the north; then he will of course have the east on his right hand, the west on his left: then let him lie down on his back, still keeping the east on his right, and then raise his feet in the air, so that he stands on his head: he will now be looking south, while east and west will still be to right and to left as before. But a person looking south in the natural way has east to the left, and west to the right. Therefore our inverted one, knowing that he is looking south, will feel as if the east were on his left, though it is not so. Thus along with his inverted position his notion of right and left is inverted. It seems to me however that such a display of athletic skill is unnecessary. All that Plato’s meaning requires is this: if A and B stand face to face, B’s right is of course opposite A’s left. But if A stand on his head, still facing B, then
they displaced, so that the double and triple intervals, being three of each sort, and the means and junctures of $\frac{3}{2}$ and $\frac{5}{2}$ and $\frac{7}{2}$, since they could not be utterly undone save by him that joined them, were forced by them to turn in all kinds of ways and to admit all manner of breaking and twisting of the circles, in every possible form, so that they can barely hold to one another, and though they are in motion, it is motion without law, sometimes reversed, now slanting, and now inverted. It is as though a man should stand on his head, resting it on the earth and supporting his feet against something aloft; in this case the man in such condition and the spectators would reciprocally see right and left reversed in the persons of each other. The same and similar effects are produced with great intensity in the soul's revolutions: and when from external objects there meets them anything that belongs to the class of the Same or to that of the Other, then they declare its relative sameness or difference quite contrariwise to the truth, and show themselves false and irrational; and no circuit is governor or leader in them at that time. And whenever sensations from without rushing up and falling upon them drag along with them the whole vessel of the soul, then the circuits seem to govern though they really are governed. On account then of all these experiences the soul is at first bereft of reason, now as in the beginning, when she is confined in a mortal body. But when the stream of growth and nutriment

B's right will be opposite A's right; the normal relation being inverted.

17. ἀπαν κύτος] The soul is, as it were, an envelope containing the περιφοραλ. Stallbaum compares Laws 964 ε, where the city is compared to a κύτος.

18. αὐταὶ κρατοῦμενα κρατεῖν δο-κούσι] Stallbaum, after Proklos, refers αὐταὶ to ἀλοθήσεις, interpreting 'they (the sensations) seem to rule the soul, which by rights rules them'. But this cannot be admitted, because the important addition 'by rights' is not in the Greek and cannot be dispensed with. Moreover the sensations do really and not only in appearance govern the soul under these circumstances. Martin's interpretation seems to me unquestionably right. αὐταὶ refers to περιδοῦς, and is the antecedent to αἰτ. When, Plato says, any sensations rush upon the περιδοῦς and carry the whole soul along with them, then the περιδοῦς seem to govern, though really they are governed. That is to say, the motion of the circles which is imparted to them by the impulse of the ἀλοθήσεις is mistaken for their own proper motion: their report of the perception is received as true, though in fact it is untrustworthy. The notion in ἀπαν κύτος seems to be that when the sensations are very overpowering, they give an impulse to the whole soul: there is no hesitation nor conflict of opinion. Since then the soul ratifies without question the report of the senses, she seems to be acting regularly and rightly.
apprehending the phenomena, whereas really she is obeying an external impulse.

1. ἔλαττον ἐπή ῥεύμα) That is to say, as the child grows older the imperious necessities of nutrition become less predominant; also the sensations from without grow less distracting. Accordingly the intellect has freer play to exercise its functions.

5. ἐμφρονα...γιγνόμενον) Note that he is only put in the way to become rational.

7. ὀρθῇ τροφῇ πανδεύσεως] These words must be taken together, the genitive depending upon τροφή. Stallbaum, governing πανδεύσεως by ἐπιλαμβάνεται, wrongly understands ὀρθὴ τροφή to refer to the diminished influx of nutriment.

ὁλόκληρος] This is a technical term of the Eleusinian ritual. Plato is fond of borrowing such terms: cf. Φαινομ. 250 c ὁλόκληρα δὲ καὶ ἀπλὰ καὶ ἀτρεμῇ καὶ εὐδαίμων φάσματα μυϊκῶν τε καὶ ἐπιτεωτὸν ἐν αὐτῇ καθαρᾷ, καθαροὶ ὅτες καὶ ἀσάμαντοι τούτων δὲ νῦν σῶμα περιφέρεσται ὑσομάξεμεν, ὀστρέου τρόπων δεδεσμευμένοι. See too Latus 759 c. Similarly ἄτελες is a ritual term. It is also possible that in τὴν μεγάλην ἀπο-

φυγὼν νόσον we have an echo of the ejaculation of the initiates, ἐφυγὼν κακῶν, εὐροῦ ἀμέσου : cf. Demosthenes de corona p. 312 § 259.

8. χωλήν] Compare 87 D, where it is said that if a disproportion exists between soul and body, the ὄνομα is ἀξιόμετρον ταῖς μεγαλίαις εὐχερείας.

τὸ βίον διαπορευθεῖς ζωήν] βιοῦ ζωῆς = 'the conscious existence of his lifetime', ζωῆ being a more subjective term than βίος. Compare on the other hand Euripides Hercules furens 664 ἀ δυσχέρεια δ' ἀπλῶν ἢ εἶσε ἤδειας βιοτάν. ἄτερά ποτε γίγνεται) i.e. belong to a later part of our exposition: the subject is in fact dealt with in chapters 41–43.

τῶν νῦν προτεθέντων] I concur with Stallbaum in referring τὰ νῦν προτεθέντα to the inquiry into the operation of the several senses, while τὰ πρὸ τούτων signifies the investigation περὶ σωμάτων κατὰ μέρη γενέσεως καὶ περὶ ψυχῆς.

13. τοῦ μάλατα εἰκότωσ] We are now fairly in the region of the physical, where we must be content with the 'probable account'.
flows in with smaller volume, and the revolutions calming down
go their own way and become settled as time passes on, then
the orbits are reduced to the form that belongs to the several
circles in their natural motion, and declaring accurately the
Other and the Same, they set their possessor in the way to
become rational. And if any just discipline of education help
this process, he becomes whole altogether without a blemish,
having made his escape from the most grievous of plagues; but
if he neglect it, he passes the days of his life halt and maimed,
and unhallowed and unreasonable he comes again to Hades.
These things however belong to a later time: we must discuss
more exactly the subject immediately before us. And as to
the matters which are previous to this, concerning the gener-
ation of the body in all its parts and concerning soul, and the
reasons and designs of the gods whereby they have come into
being, we must cling to the most probable theory, and by pro-
ceeding in this way so give an account of all.

44 D—47 E, c. xvi. The two revolu-
tions of the soul were enclosed in a spher-ical case which we call the head; and
all the rest of the body was framed that
it might minister to the head, aiding
it to move from place to place and pre-
serving it from harm. And to man the
gods assigned a forward progress as his
most natural motion; for this was more
dignified than the contrary. To dis-
tinguish front from rear they set the face
with its organs of sense in one part of
the head; and this they made the for-
ward and leading side. The first organs
they fashioned therein were the eyes that
lighten the body. Now vision comes to
pass on this wise. From the eyes issues
forth a stream of clear and subtle fire,
of the same substance as the sunlight
in the air; with which it mingles, and
the two combined meet the fire pro-
ceeding from the object which is in the
line of vision; and so the united fires,
becoming one body, transmit the vibra-
tions from the object to the eye. But
at night, when there is no more light
in the air, the visual fire on passing
forth into the darkness is quenched; and
when the eyelids are closed, the flow
of it is turned inwards, and calming the
motions that are within, it produces sleep,
more or less dreamless according as the
calm is complete.

Then it is shown how images in mirrors
arise through the reflection of the com-
bined fires when they meet upon a smooth
shining surface; how in plane mirrors
right and left are reversed in the re-
fection; and how in a concave mirror,
when it is held in one position, right and
left are not transposed, but if it be held
in another, the image is inverted.

But we must remember that all these
physical laws are but a means to an end;
we must learn to distinguish between
spiritual causes, which are primary, and
material causes, which are only sub-
sidiary: and though both must be ex-
plained, the first alone is the true object
of the wise man's search. Now the true
motive of the gods in bestowing sight
upon man was the attainment of phi-
losophy by him: for had we never seen
the celestial motions and from them
XVI. Τὰς μὲν δὴ θείας περιόδους δύο ούσια τὸ τοῦ παντὸς σχῆμα ἀπομιμησάμενοι περιφέρεσ ὦν εἰς σφαιροεῖδες σῶμα ἐνεχθέντοκαὶ τοῦτο δὲ νῦν κεφαλὴν ἐπονομάζομεν, ὁ θειοτάτου τ’ εστὶ καὶ τῶν ἡμῶν πάντων δεσποτοῦν· δὲ καὶ πάν τὸ σῶμα παρέδοσαν ὑπηρεσίαν αὐτῷ εὐναθροίσαντες θεοί, κατανοήσαντες, ὅτι πασῶν ὀσάν κινήσεις ἐσοιντο μετέχουν. ὦν μὴ κυλινδούμενον ἐπὶ γῆς ὑπῆ τε καὶ βάθη παντοδαπά ἐχοῦσης ἀπαροί τὰ μὲν ὑπερβαίνειν, Ε ἐνθεν δὲ ἐκβαίνειν, ὅχημ’ αὐτῷ τούτο καὶ εὐπορίαν ἔδοσαν· ὅθεν δὴ μήκος τὸ σῶμα ἐσχέν, ἕκτατα τε κῶλα καὶ καμπτά ἐφισε τέταρα θεοῦ μηχανησάμενον πορείαν, ὁς ἀντιλαμβανόμενον καὶ ἀπερειδομένον διὰ πάντων τῶν πορεύεσθαι δυνατὸν γέγονε, τὴν τοῦ θειοτάτου καὶ ἱερωτάτου φέρον ὀκνητὶ ἐπάνωθεν ἡμῶν. σκέλη 45 A μὲν οὖν χειρὶς τε ταῦτα καὶ διὰ ταύτα προσέφυν πᾶσι· τοῦ δ’ ὑπίσθεν τὸ πρόσθεν τιμιότερον καὶ ἀρχικότερον νομίζοντες θεοὶ ταῦτα τὸ πολὺ τῆς πορείας ημῶν ἔδοσαν. ἔδει δὴ διωρισμένον ἔχειν καὶ ἀνόμους τοῦ σώματος τὸ πρόσθεν ἀνθρωπον. διὸ πρῶτον μὲν περὶ τὸ τῆς κεφαλῆς κύτος, ὑποθέντες αὐτὸς τὸ πρόσωπον, ὀργάνα ἐνεδόθην τούτῳ πάση τῇ τῆς ψυχῆς προνοίᾳ, καὶ διέταξαν β τὸ μετέχον ἡγεμονίας τούτῳ εἶναι τὸ κατὰ φύσιν πρόσθεν. τοῖς δὲ ὀργάνων πρῶτον μὲν φωσφόρα ἐνυπεκτήσαντο ὁμματα, τούδε ἐνυπήσαντες αἰτία. τοῦ πυρὸς ὄσον τὸ μὲν καίειν οὐκ ἔσχε, τὸ δὲ παρέχειν φῶς ἡμερο, οἰκεῖον ἐκάστης ἠμέρας σῶμα ἐμηχανησάντο

XVI. Imitating the shape of the universe, which was spherical, they confined the two divine revolutions in a globe-shaped body, the same that we now call the head, which is the divinest part of us and has dominion over all our members. To this the gods gave the whole body, when they had put it together, to minister to it, reflecting that it possessed all the motions that should be. In order then that it might not have to roll upon the earth, which has hills and hollows of all kinds, nor be at a loss to surmount the one and climb out of the other, they gave it the body for a conveyance and for ease of going: whence the body was endowed with length and grew four limbs that could be stretched and bent, which the god devised for it to go withal, and by means of which clinging and supporting itself it is enabled to pass through every place, bearing at the top of us the habitation of the most divine and sacred element. In this way then and for these reasons were legs and hands added to all mankind; and the gods, deeming that the front was more honourable than the back and more fit to lead, made us to move for the most part in this direction. So it behoved man to have the front part distinguished and unlike the back. Therefore having set the face upon the globe of the head on that side, they attached to it organs for all the forethought of the soul, and they ordained that this which had the faculty of guidance should be by nature the front. And first of the organs they wrought light-giving eyes, which they fixed there on the plan I shall explain. Such sort of fire as had the property of yielding a gentle light

use of the singular compare the still stronger case in Symposium 188 b cal γάρ πάχνα καὶ χάλαζι καὶ ἐρυγίας εκ πλεονέκτας καὶ ἀκοσμίας περὶ ἄλληλα τῶν τοιούτων γίνεται ἐρωτικῶν. The construction is of course distinct from the so-called 'schema Pindaricum', in which the verb precedes its subject, and which is not so very uncommon in Attic writers.

15. [ἔθε δή] Forward motion is more dignified than retrograde; and man is to have the more dignified. But to attain this there must be something to distinguish front from rear; therefore the gods placed the sensory organs, eyes nose and mouth, on the same side of the head, forming the face; and this side they called the front.

18. διετάξαν τὸ μετόχον] This reading is distinctly preferable to διετάξαντο μέτοχον. For μέτοχον ἤγεμονὶς must be the predicate: the meaning however plainly is that the gods, to distinguish front from back, ordered that the face, which held the leading position (because it contained the ὀργάνα τῆς ἀνθρώπου), should be τὸ κατὰ φύσιν πρόσ-

22. όλεθρον ἐκάστης ἡμέρας σῶμα.] This punctuation is due to Madvig, who by
merely expunging a comma has restored sense to the passage. Ordinarily a comma is placed after ἡμέρας, leaving us to face the inconvenient problem, how could the gods make into body that which was body already? For Martin's attempt to specialise the use of σῶμα in the sense of 'definitely formed matter' is hopeless. Eschewing the comma however, we get quite the right sense—they made it into a substance similar to the daylight, which is a subtle fire pervading the atmosphere. Thus too the γὰρ immediately following, to which Stallbaum takes exception, is justified; it introduces the explanation how the gods made the fire within us similar to the fire without. There is an obvious play between ἡμέραν—ἡμέρας. For Plato's etymology of ἡμέρα see Cratylus 418 C.

4. τὸ τοιοῦτον] sc. τὸ εἰλικρινὲς καὶ λείον καὶ πυρκνὸν.

6. ἐν σῶμα οἰκειοθέν] That is to say, wherever the eye is directed, the stream of fire from the eye and the fire in the atmosphere, which is of one and the same substance with it, combine and form a ray of homogeneous fire all along the line of vision.

10. τοῦτων τὰς κινήσεις διαδιδόν] Plato's theory may thus be briefly explained. There are three fires concerned: the fire that streams from the eye, the fire of daylight in the air, and the fire in the object seen, which is the cause of its visibility. The first two are absolutely homogeneous one with the other and combine into a perfectly uniform substance. This substance, on meeting the rays from the object, receives their vibrations and transmits them to the eye, whence they are delivered to the seat of consciousness, at which point of the process perception takes place. The problem with which Plato has to deal is, how is action at a distance effected? This he ingeniously attempts to explain by the hypothesis of an extension of the substance of the percipient in the direction of the object: for the ὄψεως ῥέμα is just as much part of ourselves as the brain or hand; this is clear from 64 D. If this passage be compared with the statements in Theaetetus 156 A foll. or 182 A, it will be seen that the physical theory of the Timaeus fits in perfectly well with the metaphysical doctrine of perception in the Theaetetus.

It is plain too that Plato's theory is
but not of burning, they contrived to form into a substance akin to the light of every day. The fire within us, which is akin to the daylight, they made to flow pure smooth and dense through the eyes, having made close the whole fabric of the eyes and especially the pupils, so that they kept back all that was coarser and suffered only this to filter through unmixed and pure. Whenever then there is daylight surrounding the current of vision, then this issues forth as like into like, and coalescing with the light is formed into one uniform substance in the direct line of vision, wherever the stream issuing from within strikes upon some external object that falls in its way. So the whole from its uniformity becomes sympathetic; and whenever it comes in contact with anything else, or anything with it, it passes on the motions thereof over the whole body until they reach the soul, and thus causes that sensation which we call seeing. But when its kindred fire departs into night, the visual current is cut off: for issuing into an alien element it is itself changed and quenched, having no longer a common nature with the surrounding air,

peculiar to himself and quite diverse from the Empedoklean (or Demokritean) doctrine of effluences, with which Stallbaum confuses it; although the two theories have some points in common, as appears from the statement of Aristotle de sensu 437b 11 foll. Empedokles, as Aristotle informs us, wavered in his explanation, sometimes adopting the ἄπορος aforesaid, sometimes comparing the eye to a lantern, sending forth its visual ray through the humours and membranes which correspond to the frame of the lantern. But as propounded in the passage quoted by Aristotle (302—310 Kars-ten), this notion amounts merely to a metaphor or analogy and is not worked up into a physical theory: it agrees however with Plato in taking fire for the active force of the eye. The doctrine of effluences from the object corresponding to πόρος in the pericpient is attributed to Empedokles in Meno 76 c: see too Aristotel de gen. et corr. i viii 324b 25 foll. Plato himself assumes an effluence of rays from the object, but this has little resemblance to the Empedoklean ἄπορος. An exposition of the peculiar theory of Demokritos will be found in Theophrastos de sensu § 49 foll. Aristotle's theory of vision is expounded in de anima ii vii and de sensu ii, iii.

11. μέχρι τῆς ψυχῆς] See note on 43 C.
12. ἡ δὴ] 'whereby' we see. The physical process is the soul's instrument: cf. Theaetetus 184 c.
14. κατασβέννυται] Plato explains quite clearly what he means by 'extinguished'. The visual fire, issuing into air destituie of light, finds no kindred substance with which to coalesce: it is thus modified, and losing its proper nature becomes unable to carry on the process of vision. Aristotle however, catching at the word κατασβεννυται, asks τις γάρ ἀπόσβεσις φωτός ἐστιν; σβεννυται γάρ ἡ ὀγκώρῃ ἡ ψυχῷ τὸ θερμὸν καὶ ἐξρόν, οὐκ δεικτὸ το τέλειον ἀνθρωποσεῖν εἰμί τῷ καὶ ἡ φλέξ, ὁν τῷ φωτὶ οὐδέτερον φαίνεται ὑπάρχον. It is
impossible to exonerate criticism of this kind from the charge of ονόματων δήρεων. The reference in de anima III xii 435a 5 is apparently to Empedokles, not to Plato.

4. η δὲ διαχεί [sc. η τοῦ πυρὸς δύναμις, not, as Stallbaum has it, η τῶν βλεφάρων φύσις: to say nothing of the sense, the η δὲ is sufficient to show that the subject of διαχείς is different from that of καθεργυσι.] Plato’s view is that when the eyes are closed, the visual stream, unable to find an outlet, is directed inwards, and the smooth and subtle flow of fire mollifies and calms all the motions within, thus inducing sleep.

8. ἀφομοιωθέντα ἐντὸς] Dreams are the result of motions which are not thoroughly calmed down, whereby semblances of external things are presented to the mind from within: the κίνησις corresponding to any particular external impression producing a likeness of that impression in the sleeping consciousness. The sense is plain enough; but some difficulty attaches to the words ἐντὸς ἦξω τε. Martin, construing them with ἀφομοιωθέντα, trans- lates ‘images semblables à des objets soit intérieurs, soit extérieurs’. But what can be meant by ‘objets intérieurs’? I had thought of substituting ξυσθέων for ἦξω τε, ‘copied within from without’: in which case χερεθεῖοι τ᾿ must be read. But though this gives a good sense, it overthrows the balance of the sentence. And the text may, I think, be explained as it stands: the images are copied within—that is, in the dream-world, and recalled to mind without—that is, when we have emerged from the dream-world. For Aristotle’s theory of dreams see the treatise περὶ ἐνυπνίων.

11. ἐκ γὰρ τῆς ἐντὸς] Plato proceeds to explain the phenomena of reflection in mirrors. The rays from the object reflected are arrested by the smooth shining surface of the mirror, which they cannot penetrate: the combined ἄγων ρέμα and μεθηματικός φως are arrested on the same surface and thus come into conjunction with the rays from the object. Thus the mirror is the cause of contact between the fire of the subject and the fire of the object, and so an indirect vision is
which has in it no fire. Therefore it ceases from seeing and moreover becomes an allurement to sleep. For the gods had devised as a safeguard of the sight the structure of the eyelids; and when these are closed, they shut up the force of fire within; and this smoothes and calms the motions within; and when these are calmed, quiet ensues. And if the quiet is profound, sleep with few dreams falls on us; but if some of the stronger motions are left, according to their nature and the places where they remain, they engender visions corresponding in kind and in number; which are images within us, and when we awake are remembered as outside us. Now the explanation of reflections in mirrors and all bright smooth surfaces is no longer hard to discern. For because of the communion of the internal and external fire, which again is united on the smooth surface and in manifold ways deflected, all these reflections take place; the fire that belongs to the face coalescing with the fire of the visual current upon the surface of the smooth bright object. And left appears right and right left, because mutually opposite particles

affected. *τοῦ πυρὸς ἐκατέρου* signifies not the visual stream and the daylight, but the visual stream (combined with the daylight) and the rays from the object. These two fires combine upon the surface of the mirror (*ἐκτός*), and the *κυψέως* of this combination are transmitted along the visual stream and impressed upon the retina (*ἐντός*). The foregoing interpretation gives the best meaning I can put upon the curious phrase *τῆς ἐντός ἐκτός τε κοινωνίας*, unless we may suppose that Plato rather loosely said ‘the internal and external combination of the two fires’ for ‘the combination of the internal and external fires’. But I have strong suspicions that *ἐντός ἐκτός τε* is a marginal gloss upon *ἐκατέρου*. Seneca *natur. quaest.* 1 v 1 clearly expresses the distinctive characteristic of Plato’s theory of reflections: ‘de speculis due opiniones sunt; alii enim in illis simulacra cerni putant, id est corporum nostrorum figuras a nostris corporibus emissas ac separatas, *alii non imagines in speculo, sed ipsa adspici cor-

pura, retorta oculorum acie et in se rursus reflexa*. The italicised words express Plato’s opinion. *πολλαχίᾳ μεταρρυθμι
tοντος* refers, I conceive, to the various angles at which the rays are reflected, corresponding to the different angles of incidence.

14. *ἐμφαίνεται*] ‘are reflected’. *ἐμ-

φαίνεσθαι* is the technical term. The word *ἐμφαίνει*, ‘reflection’, does not occur in Plato but is frequent in Aristotle and Theophrastos.

*tοῦ περὶ τὸ πρόσωπον πυρός* i.e. the fire belonging to the face, which is the object reflected. We must suppose the case of a person looking at his own face in a mirror: what happens is that the ray from the face, *τὸ περὶ τὸ πρόσω-

πον*, is checked on the surface of the mirror and is then amalgamated with the visual stream, *τὸ περὶ τὴν ὑπν*, which meets it at that spot. Plato’s theory of course applies to all reflections, although in this sentence he is speaking as of a particular case.
The ray $EG$, issuing from the left of the object, is reflected along $GC$ to the left side of the eye. This is a reversal of what happens in the case of direct vision (παρά το καθεστός έθος τής προσβολής). For if $A$ and $B$ look each other in the face, $A$'s right eye will be opposite $B$'s left, and so forth: but if $A$ look at his own face in the glass, the eye in the reflection, which should be the left relatively to the reflection, will be the reflection of the right eye: for if $A$ close his right eye, the eye in the mirror opposite his right will be closed. Plato's theory then is designed to explain why it is that in a reflection the right side of the visual current comes in contact with the rays from the right side of the object, whereas in direct vision it meets the rays from the left of the object. Compare Sophist 26g C διπλούν δέ ἡμίκ αὐν φῶς. οἰκεῖον τε καὶ ἀλλότριον περὶ τὰ λαμπρὰ καὶ λεία εἰς ἐν ξυνελθόν τῆς ἔμπροσθεν εἰσόθις δύσεως ἐναντίαν αλήθησιν παρέχον εἴδος ἀπεργάζεται.

4. ένθεν καὶ ένθεν ύψη λαμβούσα i.e. a concave mirror. Plato conceives the reversal of the phenomena of reflection as appearing in a plane mirror to be due to the concavity reflecting the rays at the
of the visual current and of the object seen come into contact, contrary to the wonted mode of collision. On the other hand right appears as right and left as left, when in the act of combination with that wherewith it combines the ray changes sides. This happens when the smooth surface of the mirror is curved upwards on each side and so throws the right portion of the visual current to the left side and the converse. But if it is turned lengthwise to the face, it makes this same reflection appear completely lower upside down, thrusting the lower portion of the ray to the upper end and the upper to the lower.

All these things are among the secondary causes which God uses to serve him in carrying out the idea of the best so far as is possible. But the multitude regard them not as secondary but as primary causes, which act by cooling and heating, condensing and rarefying, and all such processes. Yet they are incapable of all reason or thought for any purpose. For the only existing thing to which belongs the possession of reason

moment of impact. In the case of a concave mirror the section $AB$ would be a curved line instead of straight; and thereby a ray from the right side, just at the moment of impact, while it is in act of amalgamating with the ray from the object, is shifted to the left side, and *vice versa.* It must be remembered that the concave mirrors of which Plato speaks are not of the sort with which we are most familiar, namely hemispherical mirrors: they are hemicylindrical: therefore when the mirror is held laterally, so that the curvature is from right to left, the position of right and left as compared with a reflection in a plane mirror is inverted; if it is held vertically (*κατὰ μήκος στραφέν τοῦ προσώπου*), so that the curvature is from top to bottom, the reflection is upside down. See Munro's note on Lucretius IV 317. If the mirror were hemispherical, or one which is concave all round from centre to circumference, both right and left and top and bottom would be inverted, as may be seen by simply looking into the bowl of a silver spoon. This case is not noticed by Plato, nor by Lucretius *I. I.* Martin gives a mathematical explanation of the phenomena.

9. τῶν ξυναίτων] Plato now proceeds to guard against being supposed to mean that the physical principles which he has just laid down are the real cause: they are merely the means through which the true cause works, viz., νοῦς operating ἐν τῷ βελτίστων. Compare *Phaedo* 99 B. The whole of this latter part of the chapter contains a polemic partly against Anaxagoras, partly against Demokritos. Anaxagoras did indeed postulate νοῦς as his prime force, but he used it simply as a mechanical agent, without attributing to it a conscious effort to produce the best result. Demokritos conceives a blind unconscious force, ἄναγκη, to be the motive power of the universe. Thus whereas the opposition between Demokritos and Plato is fundamental and essential, Plato's controversy with Anaxagoras is due rather to inconsequence or incompleteness on the part of the latter.

P. T.
ψυχήν τούτο δὲ ἀόρατον, πῦρ δὲ καὶ ὕδωρ καὶ γη καὶ ἄηρ σώματα πάντα ὀρατά γέγονεν τὸν δὲ νοῦ καὶ ἐπιστήμης ἐραστὴν ἀνάγκη τὰς τῆς ἐμφρονοσ φύσεως αἰτίας πρώτας μεταδιώκειν, ὥσας δὲ ὑπ' ἀλλων μὲν κινομένων, ἐτερα δὲ ἐξ ἀνάγκης κινούμενον.

15 ἐνιαυτῶν περίδοι μεμπράνηται μὲν ἁρμιθόν, χρόνου δὲ ἔννοιαν περὶ τῇ τοῦ παντὸς φύσεως ξήτησιν ἐδοσαν. εἰ δὲ ἐπορισάμεθα φιλοσοφικός γένός, οὐ μείζον ἁγαθὸν οὔτ᾽ ἡθεν οὔτε ἤξει ποτὲ τῇ θυτῇ γένει διωρηθὲν ἐκ θεῶν. λέγω δὴ τούτῳ ὑμᾶτων μέγιστον ἁγαθὸν τάλλα δὲ, ὥσα ἔλαττω, τί ἀν ὑμοῖμεν; οὖν ὁ μὴ φιλοσόφος

4 ἀλλων μὲν: ἄλληθεν Α. 9 ἔχειν: σχείν ΣΖ.

3. τὰς τῆς ἐμφρονος φύσεως αἰτίας] That is to say the final causes, the design of Intelligence, as distinguished from the physical means used to carry out the design. Thus in the case of vision the deúterai aítiai are the physical laws which Plato has set forth, the πρῶτα aítia is what he is presently about to state. Both classes of cause are to be investigated by the lover of truth, but the secondary only for the sake of the primary: compare 68 e.

δὸςαι δὲ ὑπ᾽ ἀλλων κινομένων] κινο- μένων, κινούμενων are partitive genitives 'such as are among things which are moved by others'. εἰς ἀνάγκης, i.e. without an intelligent purpose (since these ξιναίτα have λόγον οὐδένα οὐδὲ νῦν εἰς οὐδέν), and not of their own free will.

7. δοσαι μονοθείσαι φρονήσεως] The nature of the two causes is dealt with in the note on ἀνάγκη at the beginning of the following chapter. Plato does not mean that there is a blind force existing in nature, acting at random and producing hap-hazard effects. Such a conception is totally foreign to his system, in which the one cause, the one ἀρχή κινήσεως, is ψυχή. What he does mean is this. It is idle to treat the physical forces of nature as causes, since in themselves they have no intelligence or purpose. They are indeed designed and set in motion by Intelligence for the best ends; but the conditions of their action may be such that sometimes their immediate results are not good, and they have no power in themselves to avoid such results; they must operate inevitably according to the law of their nature. The point is well put by Mr D. D. Heath in an able essay in the Journal of Philology, vol. vii p. iii, where he is dealing with Aristotle's views of causation. 'Any agent', he
we must affirm to be soul: and this is invisible, whereas fire and water and air and earth are all visible creations. Now the lover of reason and knowledge must first seek for the causes which belong to the rational order; and only in the second place those which belong to the class of things which are moved by others and move others in turn. This then is what we must also do: we must declare both classes of causes, distinguishing between those which with the aid of reason are the creators of fair things and good, and those which being destitute of reason produce from time to time chance effects without design. Enough then of the auxiliary causes which combine in giving the eyes the power they now possess; but the great result, for the sake of which God bestowed them on us, must be our next theme. Sight, according to my judgment, has been the cause of the greatest blessing to us, inasmuch as of our present discourse concerning the universe not one word would have been uttered had we never seen the stars and the sun and the heavens. But now day and night, being seen of us, and months and the revolution of the years have created number, and they gave us the notion of time and the power of searching into the nature of the All; whence we have derived philosophy, than which no greater good has come neither shall come hereafter as the gift of heaven to mortal man. This I declare to be the chiefest blessing due to the eyes: on the rest that are meaner why should we descant? let him who loves not

says, 'natural or artificial, may produce effects which do not naturally or necessarily flow from those qualities which give it its name or constitute its kind, but which result from properties common to it and other kinds, or from circumstances which bring it into casual relation with the thing it acts upon: a coal may break your head as well as warm you'. See Aristotle physica 11 iv 195b 31 foll. In this sense only is an effect produced which is τὸ τυχὸν ἀτακτον. The falling of the coal is the natural effect of its gravity, a property bestowed upon it by νόης: and if your head happens to be in the line of the coal's descent, it is broken in con-

sequence of the 'casual relation' which is thus established between it and the coal. But this is in complete conformity with the natural laws which arise solely from the evolution of νόης.

16. Ἐξ ὥν ἐπορευόμεθα] The true final cause of sight then is the attainment of philosophy, which is the ultimate result of the knowledge of number, acquired by observation of the celestial bodies. The sciences of number and astronomy were for Plato a propaedeutic to philosophy, as we learn from Republic 525 A foll.: and it is well known that he regarded geometry as an indispensable part of a liberal education.

ἀφομοιώνθαν.
11. ὅσον τ’ αὐτοῦ κωμικῆς] The reading
of the text, although I cannot consider it
altogether satisfactory, affords a fairly
good sense. κωμική is a comprehensive
term, including much more than ‘music’
in the modern sense. Plato is therefore
limiting the signification in the present
case to such κωμικὴ as consists of musical
and vocal sounds, which he says were given
us for the sake of harmony. The high
educational value which Plato set
upon music and harmony is again and
again emphasised in his writings: see for
instance Republic 401 D, Laws 666 D.
Stallbaum’s reading and punctuation are
alike unsatisfactory. The words πρὸς
ἀκοῆν appear to me superfluous and un-
meaning: I conceive them to have been
a marginal gloss on φωνῆς.
12. ἔσονενεις ἔσοισα φορᾶς] Thus
it is brought out the significance of the
harmonic ratios in 33 B: the laws of
harmony and the laws of being are the
same; the former being just one special
aspect of the latter.
47 E—48 E, c. xvii. Hitherto our dis-
wisdom, if he be blinded of these, lament with idle moan. But on our part let this be affirmed to be the cause of vision, for these ends: God discovered and bestowed sight upon us in order that we might observe the orbits of reason which are in heaven and make use of them for the revolutions of thought in our own souls, which are akin to them, the troubled to the serene; and that learning them and acquiring natural truth of reasoning we might imitate the divine movements that are ever unerring and bring into order those within us which are all astray. And of sound and hearing again the same account must be given: to the same ends and with the same intent they have been bestowed on us by the gods. For not only has speech been appointed for this same purpose, whereto it contributes the largest share, but all such music as is expressed in sound has been granted, for the sake of harmony: and harmony, having her motions akin to the revolutions in our own souls, has been bestowed by the Muses on him who with reason seeks their help, not for any senseless pleasure, such as is now supposed to be its chiepest use, but as an ally against the discord which has grown up in the revolution of our soul, to bring her into order and into unison with herself: and rhythm too, because our habit of mind is mostly so faulty of measure and lacking in grace, is a succour bestowed on us by the same givers for the same ends.

XVII. Now in our foregoing discourse, with few exceptions, course has been entirely or mainly concerned with the works of Intelligence; but now we must likewise take account of the operations of Necessity. For all the fabric of this universe is the effect of Intelligence acting upon Necessity and influencing it to produce the best possible result. Therefore in our account of creation we must find room for the Errant Cause. And first we must set forth the origin of fire and the other elements, which no man has yet declared. But in dealing with things material we cannot find any infallible first principle whereupon to base our discourse; we must be content, as we have always said, with the probable account. And so with heaven's blessing let us set forth on a new and strange journey of discovery.

20. τα μέν οὖν παρελημνύσα[ Τ] Up to this point Plato has been treating of the general design and plan of creation, πλημ βραχεων, with some small exceptions, e.g. the account of the συμμεταφθασια which contribute to the process of vision. The inquiry into the effects of necessity, to which a great part of the remainder of the dialogue is devoted, consists of physical and physiological speculations concerning the various properties and forms of matter and their interaction one on another. This inquiry is however introduced by a metaphysical theory of the first importance, without which it
is not too much to say that no conception of Platonism as a coherent whole could be formed. A thorough study of the eighteenth chapter of the *Timaeus* is absolutely essential before we can even think of beginning to understand Plato. To this theory the present chapter is prefatory.

3. ἔξ ἀνάγκης τε καὶ νοῦς συστάσεως

The first point which it is indispensable precisely to determine is the meaning of ἀνάγκη and ἱπλανομένη αἷρα, which clearly signify one and the same thing. I have already in the note on 46 e to some extent indicated what I conceive to be Plato's meaning. In the first place it is necessary once for all to discard the notion that ἀνάγκη is in any sense whatsoever an independent force external to νοῦς: this would be totally repugnant, as I have said, to the cardinal doctrine of Platonism, that the only ἀρχὴ κινήσεως is ἐφύ. For this reason we must not suppose that there is in matter as such any resisting power which thwarts the efforts of νοῦς: this is an absolute misconception. Matter, quia matter, being soulless, is entirely without any sort of power of its own: whatever power it has is of ὡδυ. What then is ἀνάγκη or the πλανομένη αἷρα? It signifies the forces of matter originated by νοῦς, the sum total of the physical laws which govern the material universe: that is to say, the laws which govern the existence of νοῦς in the form of plurality. Now these laws, once set in motion, must needs act constantly according to their nature; else would νοῦς be at variance with itself. Therefore all nature's forces must follow their proper impulse according to the conditions in which they are for the time being: if fire and a hayrick come in collision, it is ἀνάγκη that the rick be burnt, though fire was not designed to burn ricks. But this implies no originating power in matter; it means only that νοῦς, having once evolved itself in the pluralised form, the laws of its existence in that form are constant. Material nature is a machine wound up to go of itself; νοῦς is not for ever checking or correcting its action in detail—see *Laws* 903 B foll. But there is something more to be said. It is a necessary law for νοῦς to exist in the form of material nature: and within this sphere we see that things do not always work, at any rate immediately, ἐπὶ τὸ βέλτιστον. It was impossible, we must suppose, for νοῦς to assume the form of a multitude of physical forces, all in themselves and in their design beneficent, which should not, amid the infinite complexity of their interaction, inevitably under some conditions produce effects which are not beneficent. This necessity and this impossibility constitute ἀνάγκη. It is then in the final analysis the law by which νοῦς necessarily has a mode of existence to which imperfection attaches: and the very constancy with which the law acts is the cause of the friction which arises in its manifold and complex operation. But this is no law imposed upon νοῦς by any external cause, for there is none
we have been declaring the creations wrought through mind: we must now set by their side those things which come into being through necessity. For the generation of this universe was a mixed creation by a combination of necessity and reason. And whereas reason governed necessity, by persuading her to guide the greatest part of created things to the best end, on such conditions and principles, through necessity overcome by reasonable persuasion, this universe was fashioned in the beginning. If then we would really declare its creation in the manner whereby it has come to be, we must add also the nature of the Errant Cause, and its moving power. Thus then

such: it is in the very nature of νοῦς itself in its pluralised form. The problem of the πλανωμένη αἰτία is the same as the problem concerning the nature of evil, of which Plato has offered us no explicit solution.

6. ἡττωμένης ὑπὸ πειθοὺς ἐμφρονοσ] In these words is indicated the difference between the ἀνάγκη of Plato and the ἀνάγκη of Demokritos. For Plato, although the forces of nature are inevitable and inexorable in their action, yet these forces are themselves expressly designed by Intelligence for a good end. And though in detail evil may arise from their working, yet they are so ordained as to produce the best result that it was possible to attain. Necessity persuaded by intelligence means in fact that necessity is a mode of the operation of intelligence. The necessity of Demokritos, on the other hand, is an all-powerful unintelligent force working without design; and whether good or evil, as we term them, arises from its processes, this is entirely a matter of chance. Thus in Plato’s scheme evil is deliberately limited to an irreducible minimum, while with that of Demokritos the whole question of good and evil has nothing to do.

8. τὸ τῆς πλανωμένης ἔδος αἰτίας] The name πλανωμένη αἰτία does not signify that Plato attributed any degree of uncertainty or caprice to the operation of ἀνάγκη. Every effect is the result of a cause; and just that effect and nothing else whatsoever must arise from just that cause. And were we omniscient, we could trace the connexion between cause and effect everywhere, and we could consequently predict everything that should happen. As it is, so obscure to us are the forces amid which we live, and so complex are the influences which work upon one another, that in innumerable instances we are unable to trace an effect back to its causes or to foresee the action of ἀνάγκη. Hence Plato calls ἀνάγκη the πλανωμένη αἰτία, because, though working strictly in obedience to a certain law, it is for the most part as inscrutable to us as if it acted from arbitrary caprice. We can detect the relation of cause and effect in results which are immediately due to the design of νοῦς, but frequently not in those which are indirectly due to it through the action of ἀνάγκη. It is extremely inaccurate in Stallbaum to say that the πλανωμένη αἰτία is ‘materia corporum’.

[ἡ φέρειν πέφυκεν] Literally ‘how it is its nature to set in motion’. The πλανωμένη αἰτία is the source of instability and uncertainty (relatively to us) in the order of things; whence Plato terms it the moving influence. What Stallbaum means or fails to mean by his rendering ‘ea ratione, qua ipsius naturae fert’, it is difficult to conjecture.
2. καθάπερ περὶ τῶν τότε i.e. as we began at the beginning in expounding τὰ διὰ νῦν δεδήμουργημένα, so we must begin at the beginning in our exposition of τὰ δὲ ἀνάγκης γεγραμένα.

3. πρὸ τῆς οὐρανοῦ γενέσεως] The question next arises, what is meant by the nature of fire, &c before the generation of the universe, and the conditions anterior to this? Plato evidently means that we have to analyse these so-called elements into their primary constituents. Earlier thinkers had treated them as if they were simple primary substances: Plato, however, justly maintains that they are complex. Now as these substances exist in the κόσμος, they are everywhere more or less complete and in their finished forms; therefore in analysing them into their first beginnings, we are dealing with rudimentary forms which nowhere exist in the κόσμος, but which are analytically prior to those forms which do exist in the κόσμος. But the priority is in analysis only; there never was a time in which the elements existed in these forms. Indeed when we come to see the nature of Plato's στοιχεῖα, it will be apparent that they never could have an independent existence. πρὸ τούτου = πρὸ τοῦ γενέσθαι τῶν οὐρανῶν—the state of fire, air, &c prior (in analysis) to their complete form.

8. ἐν συλλαβῖς εἰδεῖσι] This is an allusion to the common meaning of στοιχεῖα=letters of the alphabet. So far from belonging to this rank, fire and the rest are more composite even than syllables. For, as we shall see, Plato's ultimate στοιχεῖον is a particular kind of triangle, out of which is formed another triangle, and out of that again a regular solid figure, which is the corpuscle of fire.

10. ἔτει ἄρχην ἔτει ἄρχασ] Plato says he will not, like the early Ionians, attempt to find some principle or prin-
let us return upon our steps, and when we have found a second fitting cause for the things aforesaid, let us once more, proceeding in the present case as we did in the former, begin over again from the beginning. Now we must examine what came before the creation of the heavens, the very origin of fire and water and air and earth, and the conditions that were before them. For now no one has declared the manner of their generation; but we speak as if men knew what is fire and each of the others, and we treat them as beginnings, as elements of the whole; whereas by one who has ever so little intelligence they could not plausibly be represented as belonging even to the class of syllables. Now however let our say thus be said. The first principle or principles or whatever we may hold it to be which underlies all things we must not declare at present, for no other reason but that it is difficult according to the present method of our exposition to make clear our opinion. You must not then deem that I ought to discourse of this, nor could I persuade myself that I should be right in essaying so mighty a task. But holding fast the principle we laid down at the outset, the value of a probable account, I will strive to give an explanation that is no less probable than another, but more so; returning back to describe from the beginning each and all things. So now again at the outset of our quest let us call upon God to pilot us safe through a strange and un-

ciples to serve as an ἀρχή for matter, solely for the reason that in a physical inquiry (κατὰ τὸν παρόντα τρόπον τῆς διεξόδου) it is hardly possible to arrive at such an ἀρχή: a real ἀρχή can only be attained by dialectic. The Ionian ἀρχαί were no ἀρχαί at all. And so we may analyse matter into the ultimate geometrical forms, which are the law of its composition, but these are not properly speaking ἀρχαί. In the following chapter Plato, treating the subject metaphysically, does at least propound an ἀρχή for matter by far more recondite than any which had yet been conceived.

17. καὶ ἐμπροσθεν ἀπ' ἀρχής] Stallbaum, who joins μᾶλλον δὲ with what follows, proposes to read κατὰ τὰ ἐμπροσθεν. But no change is necessary. ἐμπροσθεν means ‘where we were before’, viz. at the starting-point of the inquiry. I think Martin is justified in his rendering ‘reventnant sur mes pas jusqu'au commencement’. Lindau suggests μᾶλλον δ’ ἥ κατ’ ἐμπροσθεν, which is not Greek, as I think.

18. ἐξ ἀτοποῦ καὶ ἄθικος διηγήσεως] The metaphor is evidently taken from mariners embarking on a voyage of discovery in some new and unexplored ocean. Plato prays to be delivered from the perils of the voyage and brought safe
to the haven of probability. Martin is certainly mistaken in translating ‘pour qu’elle nous préserve de discours incohérents et bizarres’. Plato shows himself fully alive to the difficulty of the subject he is about to treat and the entire novelty of his speculations. A glimpse of his theory of matter has been afforded in the *Philebus*, but here he carries his analysis far deeper. Compare 53 B, where he calls his very peculiar corpuscular theory ἀήθος λόγος.

48 E—52 D, c. xviii. We must extend the classification of all things which we formerly made. To the ideal model and the sensible copy which we then assumed must be added the substrate in which generation takes place. For consider: the four elements, as men call them, fire, air, water, earth, are continually changing places and passing one into another, so that we can never with any security say, this is fire, or this is water. Indeed we should not apply the word *this* to them at all, nor any other expression which signifies permanency: the most we can do is to say they are ‘such-like’. To the substrate alone is it safe to apply the term ‘this’. For it alone never changes its nature; but is as it were a matrix receiving all the forms that enter into it, which forms are the sensible semblances of the eternal ideas. So then we must distinguish these three, the eternal type, the generated copy, and the substrate wherein it is generated. This substrate must be without form or quality, else it would not faithfully express the images that enter into it, but would intrude its own attributes. It is not then fire nor any other of the elements, but a viewless and formless nature, which takes on it now the form of fire, anon the form of water, and all perceptible things. But since we talk of images entering in, we must ask, is there a type, an idea of fire and the rest where-of we behold the images? or are the visible images themselves the most real existence which is? We cannot dwell on this question at length: but we may briefly answer it thus. If knowledge differs from true opinion, then the ideas exist beyond the sensible images; if not, then sensibles alone are realities. Now it is a fact that knowledge differs from true opinion; for one is the result of teaching, the other of persuasion; one is the possession of all men, the other of the gods alone and but a few among mankind. Therefore the ideas exist eternally, neither passing forth of their own nature nor receiving aught therein, apprehensible by thought alone: next there are the
familiar discourse to the haven of probability; and thus let 
us begin once more.

XVIII. Our new exposition of the universe then must be 
founded on a fuller classification than the former. Then we 
distinguished two forms, but now a third kind must be disclosed. 
The two were indeed enough for our former discussion, when 
we laid down one form as the pattern, intelligible and change-
less, the second as a copy of the pattern, which comes into 
being and is visible. A third we did not then distinguish, 
deeming that the two would suffice: but now, it seems, by 
constraint of our discourse we must try to express and make 
manifest a form obscure and dim. What power then must we 
conceive that nature has given it? something like this. It is 
the receptacle, and as it were the nurse, of all becoming. This 
images called after their names, sensible 
and perishable and ever in transition: 
thirdly the receptacle of all becoming, 
which is space, imperishable and imper-
ceptible, apprehended by a kind of 
bastard reasoning. This third is the 
cause why, like men in a dream, we 
declare that everything which exists must be 
in some place, and what is nowhere in 
heaven or earth is nothing. And this 
dream we carry into the region of waking 
verity, even the ideas; we do not remem-
ber that, since an image is not its own 
type, it must be imaged in something else, 
or else be not at all: for true reason 
declares that, while the type is one, and the 
image another, they must be apart; for 
they cannot exist one in the other and so 
be one and two at once.

3. με[όνωσ] i.e. the classification must 
be more comprehensive: the former left 
no room for one of the most important 
principles in nature.

4. τοτε μεν γαρ] The reference is to 
28 A, where Timaeus divides the universe 
into δο and γεγραμενον.

5. τα μεν γαρ διο [κανα ἤν] This 
remark is most characteristic of Plato, 
who always confines himself to the limits 
of the subject in hand. He is like a good 
general, who does not call upon his re-
serves till they are wanted. So in the 
Philebus he carries his analysis of διευ-
ρον no further than to describe it as in-
definitely qualified, because that served 
all the purpose of that dialogue. And in 
the same way at the earlier stage of 
Timaeus’s exposition he distinguishes 
only such principles of the universe as 
then concern the argument.

7. μήμημα] It may be as well to 
draw attention to the fact that through-
out all the dialogue the relation of par-
ticular to idea is one of μήμης: the old 
μέθετις has disappeared never to return.

10. χαλεπὸν καί ἁμαρτὸν εἰδὸς] Plato 
repeatedly in the most emphatic language 
expresses his sense of the difficulty and 
obsccurity attaching to this question con-
cerning the substrate of material existence. 
The difficulty is recognised also in the 
Philebus, though in less forcible terms, cf. 
24 A χαλεπὸν μὲν γαρ καὶ ἁμαρτυρήσαιμον 
δ’ κελεύω σε σκοπεῖν. It must be remem-
bered too that Plato’s conception was an 
absolute novelty in philosophy. Aristotle 
has a curiously perverse reference to the 
theory of the Timaeus in de gen. et corr. 
π i 329 13 foll.

12. ὑποδοχὴν] The substrate is the 
‘receptacle’ of all things that become, 
inasmuch as it provides them with a place
to become in: it is their 'nurse'; because it fosters them, so to speak, and is the means of their existence; without it they could not exist in any way. Stallbaum's account of it as a vessel containing sensible things is most erroneous; indeed his treatment of the whole subject is as confused as it can well be. It will be convenient to defer a fuller discussion of Plato's ὑποδοχή until this conception receives its final development at the end of the chapter.

2. προσαπορθῆναι περὶ πυρὸς] This necessity arises because the conception of the ὑποδοχή as an unchanging substrate involves the conception of fire and the rest as merely transitory conditions of this substrate: therefore we must put the question, what is the real nature of this appearance which we call fire? And this in its turn raises the question of the existence of the ideas. τῶν μετὰ πυρὸς of course = air, water, earth.

5. ἀπαντὰ καθ’ ἐκαστὸν τε] i.e. to call it all or (some one) severally. The slight change of construction in καθ’ ἐκαστὸν is not at all harsh, and certainly Stallbaum's plan of joining the words with the following is not an improvement. Seeing that the four elements are perpetually interchanging there can be no propriety in giving any fixed name to any one of them: while we apply the term appropriate to one form, the substance may have passed into another.

7. εἰκότως should be joined with δια-πορθῆνες. 'raising what reasonable question'.

9. λίθους καὶ γῆν] Plato here speaks as if all four elements were interchangeable: this statement is corrected in 54 c, where we find that earth, as having a different base, will not pass into the other elements, nor they into it: the other
saying is true, but we must put it in clearer language: and this is hard; especially as for the sake of it we must needs inquire into fire and the substances that rank with fire. For it is hard to say which of all these we ought to call water any more than fire, or indeed which we ought to call by any given name, rather than all and each severally, in such a way as to employ any truthful and trustworthy mode of speech. How then are we to deal with this point, and what is the question that we should properly raise concerning it? In the first place, what we now have named water, by condensation, as we suppose, we see turning to stones and earth; and by rarefying and expanding this same element becomes wind and air; and air when inflamed becomes fire: and conversely fire contracted and quenched returns again to the form of air; also air concentrating and condensing becomes cloud and mist; and from these yet further compressed comes flowing water; and from water earth and stones once more: and so, it appears, they hand on one to another the cycle of generation. Thus then since these several bodies never assume one constant form, which of them can we positively affirm to be really this and not another without being shamed in our own eyes? It cannot be: it is far the safest course when we make a statement concerning them to speak as follows. What we see in process of perpetual transmutation, as for instance fire, we must not call this, but such-like is the

three however are interchangeable. Note however that the present statement is guarded with the qualification ὤς δοκοῦμεν. Of course this limitation of the interchangeability does not affect Plato’s argument, which is probably the reason why it is not mentioned here.

II. ἀνάπαλν δὲ. This is just the ἄνω κάτω μία of Herakleitos. Stallbaum wishes to omit τε after ἵδεαν and after κύκλον, which he would alter to κύκλῳ. There is really no occasion for any of these changes. The main participles in the sentence γεγυρώμενον, συγκριθέν, κατασβεθέν, ἀπόν, διαδιδόντα, are governed by ὁρμεῖν, while the rest are subordinate to γεγυρώμενον, which has to be supplied again with the clauses καὶ πάλιν...λίθους.

αὖθις. κύκλον is perfectly right, being a predicate to γένεσις: ‘handing on their generation as a circle’: the τε is also right, coupling διαδιδόντα and γεγυρώμενον. There is more to be said for omitting τε after ἵδεαν; in which case συγκριθέν and κατασβεθέν would be subordinate to ἀπόν: but as it is in all the mss. I have not thought fit to expunge it.

20. μὴ τοῦτο ἀλλὰ τὸ τοιοῦτον] That is to say, we must not speak of it as a substance, but as a quality: in Aristotelian phrase, it is not ὑποκειμένον, but καθ’ ὑποκειμένον. τοῦτο denotes what a thing is, τοιοῦτον what we predicate of it. Fire is merely an appearance which the ὑποδοχή assumes for the time being: we must not say then ‘this portion of space
agoreuein πῦρ, μήδε ὑδάρ τούτου ἄλλα τὸ τοιούτου ἕι, μηδε ἄλλο ποτὲ μηδὲν ὡς των ἔχουν βεβαιώτητα, ὅσα δεικνύντες τῷ φήματι ἔ τῷ τόδε καὶ τούτῳ προσχρομένοι δηλοῦν ἡγομέθα τῷ φεύγει γὰρ ὅπως ὑπομένου τὴν τοῦ τόδε καὶ τούτῳ κ羕 τὴν τόδε καὶ πᾶσαν ὅση 5 μόνιμα ὡς ὅτα αὐτὰ ἐνδεικνυται φάσις. ἀλλὰ ταῦτα μὲν ἔκαστα μή λέγειν, τὸ δὲ τοιοῦτον [αἱ περιφρομένου ὁμωλος] ἐκάστου πέρι καὶ ἤμπου τοῦ ὄντος καλεῖν καὶ δὴ καὶ πῦρ τὸ διὰ παντὸς τοιοῦτον καὶ ἀπαν ὅσοντερ ἀν ἔχῃ γένεσιν. ἐν δὲ ἐγγυγόμενα αἱ ἐκαστα αὐτῶν φαντάζεται καὶ πᾶλιν ἐκείθεν ἀπόλλυται, μοῦνον ἐκείνῳ αὖ προσαγορεύει τῷ τε τοῦτο καὶ τῷ τόδε προσχρομένους 50 Λ ὀνόματι, τὸ δὲ ὑπονοοῦν τι, θερμὸν ἣ λευκὸν ἢ καὶ ὄτιον τῶν ἐναντίων, καὶ πάντ' ὅσα ἐκ τοῦτον, μηδὲν ἐκεῖνο αὖ τοῦτον καλεῖν. έτι δὲ σαφέστερον αὐτοῦ πέρι προσωριητέον αὐθίς εἰπεῖν, εἰ γὰρ πάντα τις σχῆμα πλάσας ἐκ χρυσοῦ μηδὲν μεταπλάττων 15 πανοῦτο ἐκαστα εἰς ἄπαντα, δεικνύτως δὴ τῶν αὐτῶν ἐν καὶ ἐρμόμενον τι ποτ' ἐστι, μακρὸ πρὸς ἀλήθειαν ἀσφαλέστατων εἰπεῖν Β ὅτι χρυσός, τὸ δὲ τρήγονον ὅσα τε ἄλλα σχῆμα ἑνεγύγνετο,

4. τοῦ τόδε καὶ: τοῦ τόδε καὶ τῆς S. 6 ὁμωλος scripsi suadente S. ceteri ὁμοιο. 16 ἐρμόμενον: προσερμόμενον S.

is fire", but 'this portion of space has the property of fire for its present condition'. For the same portion of space may presently assume the appearance of air and of water; whence we see that the only permanent thing is the space; fire, air, water are merely its transitory attributes derived from the ὁμοιώματα impressed upon it.

3. τῷ τόδε καὶ τοῦτο] Compare Theaetetus 157 B τὸ δ' ὥσ ὡς ὁ τῶν σοφῶν λόγος, οὐτε τι ἔγνωσεν οὔτε τοῦ οὗτ' ἑμοῦ οὔτε τόδε ὃν' ἐκεῖνο οὔτ' ἄλλο οὔδεν ἔδομα, δ' τι ἄν ἢτη. Also 183 A δε δὲ οὔτε τόδε τὸ ὄντων λέγειν' οὔτε γὰρ ἐν εἰς κινοῦτο τὸ ὄντων' οὖθ' αὖ μὴ οὔτω' οὔδε γὰρ τότε κινοῦσι' ἄλλα τι' ἄλλον φωνὴν δετέον τοῖς τῶν λόγων τοῦτον λέγουσιν, ὥσ ὡς γέ πρὸς τὴν αὐτῶν ὑπόθεσιν οὐκ ἔχουσιν ἱμάτα, εἰ μὴ ἁρὰ τὸ οὐδ' ἐπου. Thus we see that what is in the Theaetetus described as the ὁεκειοτάτη διδακτος of the Herakleiteans is here expressly adopted by Plato as his own, when he speaks of material phenomena.

6. μὴ λέγειν] The infinitives still depend upon ἀσφαλέστατα in D. περιφρομένου ὁμωλος] On the suggestion of Stallbaum I have adopted ὁμωλος for ὁμοιο. The meaning is that the term τοιοῦτον keeping pace with the elements in their transformations (περιφρομένου) can always be applied to any of them in the same sense (ὁμωλος). That is to say τοιοῦτον is a word which does not denote a permanent substance but a variable attribute: therefore we can apply it to fire &c without fear of treating such qualities as substantial fixities. If ὁμωλος be retained, it must be regarded as a predicate, and the sense will still be the same: but I think the construction is too awkward to have come from Plato. For perifropermou compare Theaetetus 202 Λ ταῦτα μὲν γὰρ περιτρέχοντα πᾶσι προφέρεσαι: where ταῦτα = αὐτό, ἐκεῖνο, ἐκαστον and the like.

7. τὸ διὰ παντὸς] i.e. fire is the name
appellation we must confer on fire; nor must we call water this, but always such; nor must we apply to anything, as if it had any stability, such predicates as we express by the use of the terms this and that and suppose that we signify something thereby. For it flees and will not abide such terms as this and that and relative to this, and every phrase which represents it as stable. The word this we must not use of any of them; but such, applying in the same sense to all their mutations, we must predicate of each and all: fire we must call that which universally has that appearance; and so must we name all things such as come into being. That wherein they come to be severally and show themselves, and from whence again they perish, in naming that alone must we use the words that and this; but whatever has any quality, such as white or hot or any of two opposite attributes, and all combinations of these, we must denote by no such term.

But we must try to speak yet more clearly on this matter. Suppose a man having moulded all kinds of figures out of gold should unceasingly remould them, interchanging them all with one another, it would be much the safest thing in view of truth to say that it is gold; but as to the triangles or any we give to such and such a combination of attributes wheresoever in nature it may appear.

9. μόνον ἐκείνο] To the ὑποδοχή, on the other hand, we can and must apply the word τούτο, because it is ever un-changing. The manifold forms it assumes are merely impressed on it from without; underlying them all its own nature is the same.

11. όποιον τῶν ἐναντίων] Not the opposites to hot and white, but any of the ἐναντιότητες which are the attributes predicatable of matter. ὅσα ἐκ τούτων signifies any combination of simple qualities.

14. πλάσας ἐκ χρυσοῦ] Aristotle gives a strange turn to this, de gen. et corr. II i 329a 17. Referring to the illustration of the golden figures he says, καὶ τοῦτο καὶ τοῦτο οὗ καὶ ἐντεινῇ τοῦτον τὸν τρόπον λεγόμενον, ἀλλὰ δὲν μὲν ἀλλοιώσεις, ἕστιν οὖτως, ὅν δὲ γένεσις καὶ φθορά, ἀδύνατον ἐκείνῳ προσαγορεύεσθαι εἷς ὁ γέγονεν. καὶ τοιού ἀρχαῖο ἀληθεύσατο εἰσὶν χρύσῳ λέγειν ἔκαστον ἐναι.

How this criticism applies I fail to see. That which suffers γένεσις καὶ φθορά is the shapes, whether in the ὑποδοχή or in the gold. These shapes have not their γένεσις from the ὑποδοχή nor from the gold: Plato accurately describes the ὑποδοχή not as ὑν ἐς ὧδε, which it is not, but as ὑν ἐς ὡσεῖς, which it is. When Plato bids us say 'this is gold', not 'this is a cube', he does not mean that the cubic shape is gold, or that a cubic shape is generated out of gold; but that in calling it gold we designate the substance, whereas if we call it a cube, we are designating an attribute which is accidental and transitory. In the golden cube the gold is (or rather serves to illustrate) τοῦτο, the substance, the cubic form is τοῦτον, the quality.
2. ἔαν ἄρα καὶ τὸ τοιοῦτον] Plato warns us that we have gone to the uttermost verge of security in venturing to describe phenomena even in terms of quality: the advanced Herakleitean point of view is as conspicuous here as in the passages quoted above from the Theaetetus.

4. ταύτων αὐτὴν ἀεὶ προσρητέον] We are not here to take ταύτων in the technical sense in which it is used in 35 A. For as the ὑποδοχή is the home of γεγυμένα, as it is the region of thought as pluralised in material objects, it must belong to the domain of βάτερον: and thus ταύτων will simply denote the changelessness of the substrate contrasted with the mutability of the phenomena. Nevertheless, as we saw that there is a sense in which time may be spoken of as eternal (see 37 D), so there is a sense in which the principle of ταύτων may be said to inhere in βάτερον. The phenomena which belong to the sphere of pluralised thought are transient, but this mode or law of their appearance under the form of space is changeless. Considered as the law or principle of pluralised existence the ὑποδοχή may be termed eternal.

7. ἐκμαγεῖον] Thus we have two immutable fixities, the ideas and the ὑποδοχή, between which is the fluctuating mass of sensible appearances.

9. τὰ δὲ εἰσύντα καὶ ἕξιόντα] These forms which pass in and out of the substrate are of course not the ideas, which go not forth into aught else: here comes in the difference between the Platonism of the Timaeus and that of the Republic and
other shapes that were impressed on it, never to speak of them as existing, seeing that they change even as we are in the act of defining them; but if it will admit the term such with any tolerable security, we must be content. The same language must be applied to the nature which receives into it all material things: we must call it always the same; for it never departs from its own function at all. It ever receives all things into it and has nowhere any form in any wise like to aught of the shapes that enter into it. For it is as the substance wherein all things are naturally moulded, being stirred and informed by the entering shapes; and owing to them it appears different from time to time. But the shapes which pass in and out are likenesses of the eternal existences, being copied from them in a fashion wondrous and hard to declare, which we will follow up later on. For the present however we must conceive three kinds: first that which comes to be, secondly that wherein it comes to be, third that from which the becoming is copied when it is created. And we may liken the recipient to a mother, the model to a father, and that which is between them to a child; and we must remember that if a moulded copy is to present to view all varieties of form, the matter in which it is moulded cannot be rightly prepared unless it be entirely bereft of all those

Phaedo: they are, like the πέρας ἔχωντα of the Philebus, the form, as distinguished from the substance of material objects, apart from which they have no independent existence; they are in fact (apart from their relation to the ideas) practically indistinguishable from Aristotle's ἐἶδος as opposed to ἔλη. These are the visible semblances of the invisible verities of the ideal world, whereupon they are modelled in a mysterious manner hard to explain: for it is not easy to understand how the immaterial is expressed in terms of matter, or the invisible represented by a visible symbol. The ἐισίότατα must then be distinguished (logically, for they are never actually separable) from the material objects which they inform; these objects are ἐισίότατα + ἐκμαγεῖον.

P. T.

11. δὴ ἐσμαΐνει μέτιμεν] This refers probably to the conclusion of the chapter, 52 C.

15. ἐκγνωσ] The ἔγνωσ are the material phenomena formed by the impress of the εἰσίότατα upon the ἐκμαγεῖον.

16. ἰδεῖν ποικλὸν] ἰδεῖν follows τοικλοῦ, to which πάσας ποικλας is a cognate accusative. Plato is rather fond of this construction with ἰδεῖν, cf. Phaedo 84 C, Republic 615 E, Phaedrus 250 B.

18. ἀμορφον δὲ] Aristotle has derived from hence his description of the thinking faculty, de anima iii iv 429a 15 ἀπαθεὶς ἄρα δέ εἰσαι, δεκτικὸν δὲ τοῦ ἔδους καὶ δυναίς τοιούτον, ἀλλὰ μὴ τότο... ἀνάγκη ἄρα, ἐπεὶ πάντα νοεῖ, ἀμυγὴ εἶναι, ὥσπερ φησίν Ἀναξαγόρας, ἵνα κρατή, τούτο δ' ἐστὶν ἵνα γνωρίζῃ—παρεμφαινόμενον γάρ
καλέει τὸ ἀλλότριον καὶ ἀντιφάττει. It will be observed that the passage of Aristotle is full of verbal echoes of the Timaeus: and his ἀκαθή applied to the mind is exactly equivalent to Plato’s ἀμορφον applied to the ὑποδοχή.

18. τῶν ἰδεῶν] Not the ideas, which do not enter into the ὑποδοχή, but the shapes which symbolise them—the ἱερών ταῦτα καὶ ἐξώντα.

3. τὴν αὐτοῦ παρεμφαίνον δῆμν] If the ὑποδοχή had any quality of its own, this quality would mingle with that impressed upon it by any of the ἱερών ταῦτα and mar the faithfulness of the μημημα. The only condition which the ὑποδοχή imposes upon our sensuous perceptions is that they shall exist in what we term space: we can perceive nothing that is not in space. Sensuous perceptions, as we have said, are symbols of the ideas: now it is quite free to the senses to symbolise an idea by the perception of round or square or any other shape, without any interference from the ὑποδοχή. The latter παρεμφαίνει τὴν αὐτῆς δῆμον just in so far as round square and the like are and must be shapes that have extension.

6. μηχανωται...ποιοῦσι] These two words are in a kind of apposition. Compare Euripides Heraclidae 181 ἀνακοποῖται ὑπόρχει μὲν τὸν ἐν τῇ σῇ χείρι, μὲν ἐπὶ ἀκούσατα γένεστι μοι. This same simile of the unguent is used by Lucretius II 848 to illustrate the necessary absence of secondary qualities from his atoms.

10. τῶν πάντων ἄντι τοῦ ὑπότου] Stallbaum would omit the τε, and νοητῶν has been proposed instead of πάντων. But πάντων is indispensable: it is because the ἐκμαγεῖον has to receive all forms that it can have no form of its own. Nor is the omission of τε satisfactory. Plato would probably have written πάντων τῶν ἄντι ὑπότου. I think the text may be defended as it stands, ἄντι τοῦ ὑπότου being added to explain what is meant by τῶν πάντων—
forms which it is about to receive from without. For were it like any one of the entering shapes, whenever that of an opposite or entirely different nature came upon it, it would in receiving it give the impression badly, intruding its own form. Wherefore that which shall receive all forms within itself must be utterly without share in any of the forms; just as in the making of sweet unguents, men purposely contrive, as the beginning of the work, to make the fluids that are to receive the perfumes perfectly scentless: and those who set about moulding figures in any soft substance do not suffer any shape to show itself therein at the beginning, but they first knead it smooth and make it as uniform as they can. In the same way it behoves that which is fitly to receive many times over its whole extent likenesses of all things, that is of all eternal existences, to be itself naturally without part or lot in any of the forms. Therefore the mother and recipient of creation which is visible and by any sense perceptible we must call neither earth nor air nor fire nor water, nor the combinations of these nor the elements of which they are formed: but we shall not err in affirming it to be a viewless nature and formless, all-receiving, in some manner most bewildering and hard to comprehend partaking of the intelligible. But so far as from what has been said we may arrive at its nature, this would be the most just account

all things, that is, all eternal existences. Perhaps however we should read del pore otnov.

12. αὐτῷ προσήκειν] Stallbaum erroneously considers αὑτῷ to be redundant: it is emphatic—'must itself be destitute of all forms'.

14. μὴν γάρ] It is indeed hard to conceive how Aristotle would attempt to justify his assertion in de gen. et corr. 11 i 339* 13 ὅσι δ' ἐν τῷ Τιμαίῳ γέραις ταῖς οὐδὲν ἔχει διορισμοῦ: αὐτὸ γὰρ ἔλεγχε σαφῶς τὸ πανδηχεῖς, εἰ χωρίζεται τῶν στοιχείων. If Plato has not most explicitly characterised the relation between the πανδηχεῖς and the στοιχεῖα, then there is no such thing as precision in language. But the truth is, as not rarely happens when Aristotle is at cross purposes with Plato, that Aristotle is treating from a physical point of view a subject which Plato deals with metaphysically.

16. μεταλαμβάνον δὲ ἀπορώτατ᾽ πη τοῦ νοητοῦ] Plato's meaning is more fully expressed in 52 b. The puzzle arises from the fact that this υποδοξά, though it does not form part of real existence, is yet grasped by the reason and not by the senses. In the metaphysical scheme represented by the Phaedo we should find that constituting the test of reality, the object of reason being a real existence, the object of sense an unreality. But now we have found an anomalous principle which defies this test. It is not surprising then that Plato describes it as δισαλωτήτατον.

12—2
3. μμήματα τούτων] i.e. τοῦ δ' ἐστὶν ἄρι and τοῦ δ' ἐστι γῆ.
4. ἄρ' ἐστι τῷ πῦρ] When we say the ὑπόθεσιν receives the μμήμα of fire, we are assuming the existence of an essential idea of fire: it is now time to justify this assumption. The list of ideas in the Timaeus includes, in addition to ideas of living creatures, only the ideas of fire air water and earth: see Introduction § 33. Presently in the words εἴδος ἐκάστου νοητοῦ we are to understand by ἐκάστος only every class naturally determined, τῶν ὁποῖα φύον.
9. τὸ δὲ οὖθεν ἄρ' ἢν πλὴν λόγοι] By λόγος Plato means a mental concept, or universal: the question is in fact between Sokraticism and Platonism; that is to say, between conceptualism and idealism.
11. διασκυρήσμουν ἔχειν οὖτως] It is not often that Plato addresses himself to prove the existence of the ideas; the mere fact that it is impossible to find any stable reality or basis of knowledge in the material world is sufficient warrant for affirming the existence of the immaterial. Here the existence of ideas stands or falls with the distinction between knowledge and true opinion. Compare the discussion in Republic 476 e—480 a, also Meno 97 a foll. In the Phaedo a different line is taken, the existence of the ideas being deduced from ἀνάμνησις.
18. θετέον βεβαιότατα] i.e. we must accept them for the truest realities that exist, however fleeting and mutable they may be. For if there are no ideas, particulars are more real than the λόγοι.
of it. That part of it which is enkindled from time to time appears as fire, and that which is made liquid as water, and as earth and air such part of it as receives the likenesses of these.

But in our inquiry concerning these we must deliver a stricter statement. Is there an absolute idea of fire, and do all those absolute ideas exist to which in every case we always ascribe absolute being? Or do those things which we actually see or perceive with any other bodily sense alone possess such reality? and is it true that there are no manner of real existences beyond these at all, but we talk idly when we speak of an intelligible idea as actually existent, whereas it was nothing but a conception? Now it does not become us either to dismiss the present question unjudged and undecided, simply asserting that the ideas exist, nor yet must we add to our already long discourse another as long which is subordinate. But if we could see our way to a great definition couched in brief words, that would be most seasonable for our present purpose. Thus then do I give my own verdict: if reason and true opinion are of two different kinds, then the ideas do surely exist, forms not perceptible by our senses, the objects of thought alone; but if, as some hold, true opinion differs nothing from reason, then all that we apprehend by our bodily organs we must affirm to be the most real existence. Now we must declare them to be two, because they are different in origin and unlike in nature. The one is engendered in us by instruction, the other by persuasion; the one is ever accompanied by right understanding, the other is without understanding; the one is not to be moved by per-

which are merely formed from observation of them: but if the ideas exist, then ἄλλα are more real than particulars, because the former are the intellectual, the latter only the sensible images of the ideas: cf. Phaedo 99 ε.

19. Χωρὶς γεγόνατον ἄνομολος τε ἔχετον They are of diverse origin, because one springs from instruction and the other from persuasion; of diverse nature, because one is immovable by persuasion, the other yields to it. You may persuade a man that pinchbeck is gold, but you never can persuade him that two straight lines enclose a space. It will be observed that the difference between knowledge and opinion rests here upon the same reasoning as the final rejection of the claims of ἀληθῆς δόξα in Theaetetus 201 ά—ε, where Sokrates, after showing that a jury may be persuaded by a skilful advocate to hold a right opinion on a case the facts of which they do not know, concludes his argument thus: οὔτε ἂν, ὅ φιλε, εἴ τε ταῦτα ἦν δόξα τε ἀληθῆς καὶ ἐπιστήμη, ὡρᾶ ποτ' ἂν δικαστὴς ἄρος ἐβάλαξεν ἄνεν ἐπιστήμην. νῦν δὲ εἰσεῖν ὅλλο τι ἐκάτερον εἶναι.
metapoeistov' καὶ τοῦ μὲν πάντα ἀνδρα μετέχειν φιλέων, νοῦ δὲ θεοὺς, ἀνθρώπων δὲ γένους βραχύ τι. τούτων δὲ οὕτως ἐχόμων ὄρμοσινοι ἐν μὲν εἶναι τὸ κατὰ ταῦτα εἰδος ἔχον, ἀγνοητον καὶ 52 Ἅ ἄνωλθρον, οὔτε εἰς εαυτὸ εἰσδεχόμενον ἄλλο ἄλλοθεν οὔτε αὐτῷ εἰς ἄλλο ποι ἴνων, ἀύρατον δὲ καὶ ἄλλος ἀναίσθητον, τούτο δ ὅ νόσος εἰληχὲν ἐπισκοπεῖν τὸ δ ὀρμώνυμον ὄρμον τε ἐκείνῳ δεύτερον, αἰσθητον, γεννητον, πεφορμημένον αἰ, γιγνόμενον τε ἐν τιν τότῳ καὶ πάλιν ἐκείθεν ἀπολλύμενον, δίξη μετ' αἰσθήσεως περιληπτόν· τριτον δὲ αὐ γένος ὑν τὸ τῆς χώρας ἁλ, φθοράν οὐ προσδεχόμενον, 3 ἁγνητον: ἁγνητον HSZ. sed cf. Phaedr. 245 D.
7 πεφορμημένον: πεφορμημένον Α.

1. πάντα ἀνδρα μετέχειν] cf. Theaetetus 206 D.
4. οὔτε αὐτῷ εἰς ἄλλο ποι ἴνων] Here we have a perfectly unmistakable assertion of the solely transcendental existence of the ideas. The difficulties raised against the doctrine of immanent ideas in Parmenides 131 A are fatal and insurmountable. From that time forth παρονοσια and μεθέσις (in connexion with αὐτά καθ' αὐτά εἶδος) disappear from Plato's vocabulary, and μιμησισ takes their place. It may be added that the previous words οὔτε εἰς εαυτὸ εἰσδεχόμενον ἄλλο ἄλλοθεν would seem enough in themselves to dispose of Zeller's theory of particulars inherent in the ideas.
8. δίξη μετ' αἰσθήσεως] Cf. 28 A, where ἄλογον is added.
9. τὸ τῆς χώρας ἁλ] Thus then we have materiality in its ultimate analysis reduced to space or extension. It may now be desirable to scrutinise Plato's conception a little more closely. First then as to the relation of χώρα to the absolute intelligence and to finite intelligences. Absolute ρωδις or ψυχη evolves itself into the form of a multitude of finite intelligences. For these it is a necessity of their nature that they should apprehend, quia finite, under certain unalterable forms, which we call time and space. Therefore whatever they perceive, they perceive somewhere. But this somewhere is relative to them and purely subjective (for we know that Plato's Herakleitanism so far as concerns the region of sensibles was complete). All sensible perceptions then have no existence except in the consciousness of the percipient. But the law which binds particular ψυχη to apprehend in this mode is immutable and eternal: hence space must be eternal; for ψυχη must exist not only in the mode of unity but in the mode of plurality, in the form of limited souls. There must then always be finite intelligences peripient of a material universe existing in space. So far then as we confine our view to the relation of the material universe to the finite percipients, we find Plato's position to be a form of subjective idealism. But as soon as we consider the relation of finite percipients and their perceptions to the absolute intelligence, we shall find that the subjective is merged in an absolute idealism. For these percipients and perceives with the law which binds them to perceive and be perceived in this mode, though regarded as individuals they are severally transient and subject to time and space, yet regarded as a whole constitute one element in the eternal and spaceless process of thought, the element of θατερον. And thus are material phenomena said to be μηματα τῶν ὄντων: they are perceptions existing in the consciousness of finite intelligences, which perceptions are the mode in which finite intelligences, acting through the senses, apprehend the ideas
suaion, the other yields to persuasion; true opinion we must admit is shared by all men, but reason by the gods alone and a very small portion of mankind. This being so, we must agree that there is first the unchanging idea, unbegotten and imperishable, neither receiving aught into itself from without nor itself entering into aught else, invisible, nor in any wise perceptible—even that whereof the contemplation belongs to thought. Second is that which is named after it and is like to it, sensible, created, ever in motion, coming to be in a certain place and again from thence perishing, apprehensible by opinion with sensation. And the third kind is space everlasting, admitting not destruction, but as existing in infinite intelligence. The phenomena are material symbols of ideal truths: and it is only by these symbols that a finite intelligence, so far as it acts through the senses, can apprehend such truths.

Plato’s identification of the ὑποδοξή with χώρα arises from the absolute ἀπάθεια of the former. ‘The manner of approaching it may perhaps be most readily seen in the following way. Let us take any material object, say a ball of bronze. Now every one of the qualities belonging to the bronze we know to be due to the μέμημα which informs the ὑποδοξή: therefore to reach the ὑποδοξή we must abstract, one after another, all the attributes which belong to the bronze. When these are stripped away, what have we remaining? simply a spherical space of absolute vacancy. The ὑποδοξή then, as regards the bronze ball, is that sphere of empty space. But still this void sphere is something; because it is defined by the limits of the air surrounding it: it is in fact a sphere of emptiness. But now suppose, instead of abstracting the qualities from the bronze alone, we abstract them from the whole universe and all its contents: then we have vacancy coextensive with the universe. But mark the difference. The empty sphere we could speak of as something, because it was the interval between the limits of the surrounding air. But our universal vacancy there is nothing to limit, there is nothing to be contrasted with it to give it a differentia, it is vacancy undefined: that is to say, it is just nothing at all. Thus we see that space pure and simple is an abstract logical conception; extension without the extended is nothing, for space can no more exist independently of the things in it than time can exist without events to measure it. Thus in its most abstract significance χώρα is the eternal law or necessity constraining pluralised ψυχή to have its perceptions under the form we call space; since then ψυχή does, and therefore must, evolve itself under this form and not another, χώρα ultimately represents the law that ψυχή shall pluralise itself.

Between Plato’s χώρα and Aristotle’s δύνα the only difference physically seems to me to lie in the superior distinctness and definiteness of Plato’s conception: it was the intense vividness of Plato’s insight that led him to the identification of the substrate with space. Aristotle, whose δύνα is taken bodily from Plato, ought to have made the same identification: that he did not do so is due to the mistiness which pervades his whole thought as compared with Plato’s.

A few words are demanded by Aristotle’s reference to the Platonic theory in physica iv ii 209b 11. Aristotle there affirms that Plato identifies the μετάληπτικόν with χώρα, but that he gives one account of the μετάληπτικόν in the Τί-
im Timäus die Frage aufwirft: was ist die Materie? und darauf antwortet: der Raum; so fragt Aristoteles; was ist der Raum? und lässt Platon darauf antworten: die Materie'.

1. *met' anaiosthias ap' ton logismou tui nothoi* None of our senses can intimate to us the existence or nature of space; it is attained only by an effort of logical analysis, *logismos*. Yet space is no real existence; therefore it cannot be the object of reason properly so called, which deals with ideal truth. Plato says then it is reached by a kind of bastard reasoning, which is indeed a purely mental process, unaided by the senses, yet distinct from the true activity of the soul when she is engaged on her proper objects of cognition. It is, as I have said, the anomaly of these conditions from which the obscurity of the subject arises. The compiler of the *Timaeus Locus* (94 b) seeks to explain *nôthos* by the words τῷ μήπω κατ' εὐθυνωριαν νοῆσαι ἀλλὰ κατ' ἀναλογίαν.

2. *muqis pistôn* *pistis* is the word used in the sixth book of the *Republic* to denote the mental *paidema* which deals with sensible objects. Space then is *muqis pistôn*, because, although it is the mode
affording place for all things that come into being, itself apprehensible without sensation by a sort of bastard reasoning, hardly matter of belief. It is with this in view that dreaming we say that all which exists must be in some place and filling some space, and that what is neither on earth nor in heaven anywhere is nought. All these and many kindred fancies have we even concerning that unsleeping essence and truly existing, for that by reason of this dreaming state we become impotent to arouse ourselves and affirm the truth; namely, that to an image it belongs, seeing that it is not the very model of itself, on which itself has been created, but is ever the fleeting semblance of another, in another to come into being, clinging to existence as best it may, on pain of being nothing at all; but to the really existent essence reason in all exactness true comes as an ally, declaring that so long as one thing is one and another thing is other, neither of them shall come to be in the other, so that the same becomes at once one and two.

in which sensible things are perceived, it is not itself an object of sensation: it is an ambiguous and doubtful form, hard to grasp and hard to trust.

\[ \text{πρός δ ἐη} \] It is this that causes our vague and dreamy state of mind regarding existence. Because everything of which our senses affirm the existence exists in space, we rashly assume that all things which exist exist in space, and that what is not somewhere is nothing. For we are held fast in the thraldom of our own subjective perceptions, and suppose, as dreamers do, that the visions within our own consciousness are external realities. It must be remembered that Plato was the very first who had any real conception of immaterial existence.

6. \[ \text{τὴν ἄνωθεν} \] i.e. the region of objective truth, which we apprehend with our waking faculties, that is to say, by pure reason unhampered by sensation. We do not conceive of the ideal world as it really is, independent of all conditions of time and space.

8. \[ \text{ἐπείρῃ αὐτῷ αὐτῷ τούτῳ} \] I believe the true construction of these words has escaped all the editors and translators, who are consequently in sore straits what to make of \text{ἐαυτῆς}. The construction seems to me to be a very simple and very Platonic \text{σχῆμα πρὸς τὸ σημαίνειν.} What is meant by \text{αὐτῷ τούτῳ ἐφ᾽ οὐ γεγονεν?} of course the \text{παράδειγμα}, and the whole phrase governs \text{ἐαυτῆς} just as if \text{παράδειγμα} had been written: 'since it is not the original-upon-which-it-is-modelled of itself'.

10. \[ \text{ἐν ἐπείρῳ τῳ}\] Since the image is not identical with the type, it must be manifested in some mode external to the type, that it may be numerically different. This external mode is what we term space. Space then is that which differentiates the image from the idea and thereby enables the former to exist, \text{ὅπλα ἀμφιέτους ἀντικείμενον.} It is a dubious kind of existence that is in space: but, such as it is, it is owing to space: for did not space exist, nothing would remain but the idea; and since the image cannot be in that, it could not be at all.

13. \[ \text{οὐδέτερον ἐν οὐδέτερῳ} \] Here again we have a distinct repudiation of
the old doctrine of παρουσία. That doctrine affirmed that the idea existed (1) in its own independent nature, (2) inherent in the particulars. The latter mode is now declared to be impossible for the plain reason that things cannot be two and one at the same time, nor can the same thing be at once original and copy. If the copy were inherent in the original, or the original in the copy, the difference between them would be lost; and we should once more be reduced to a bare denial of the existence of the material world. It will be observed that the rejection of μεθέξεις is here based upon a different ground from that taken up in the Parmenides, although the criticism in that dialogue remains perfectly valid. We see then the truth of Aristotle's statement in μεταφρ. 1 vi that Plato was led, in opposition to the Pythagoreans, to place the ideas παρὰ τὰ αἰσθητα through his logical speculations, διὰ τὴν ἐν τοῖς λόγοις σκέψιν.

52 D—53 C, c. xix. All the universe then is divided into Being Space and Becoming, these three. And space, receiving the forms that enter in, and being thereby filled with unbalanced forces, is nowhere in equipoise but ever swaying to and fro over its whole expanse. And thus too it sways in turn the things that arise in it and sifts them, so that the lighter bodies fly off to one region, and the heavier settle in another. Thus, even in the rudimentary state, wherein without the working of intelligence they would have been, the different bodies tend to occupy different regions in space; and yet more, when all is ordered by intelligence for the best, as we affirm to be the truth. And now we must set forth the order and generation of them.

1. λογισθείς...λόγος] Compare 34 A λογισμὸς θεών περὶ τῶν ποτὲ ἐσόμενων θεῶν λογισθέως.

2. τρία τριχεὶς] This seems to mean no more than ‘three things with three distinct natures’: cf. 89 E τρία τριχεὶς ψυχεῖν ἐν ἡμῖν εἶθε κατψίκτα. Of course this triad is not in any way to be confounded with the former triad of ταῦταν θάτερον and ὀισία.

3. καὶ πρὶν ὀφράν γενέσθαι] This, it need hardly be said, is again to be taken logically: these three are prior in analysis.

6. μὴδ᾿ ὀρμοῖν δυνάμεων] The manifold bodies which are generated in space have most diverse and unequal forces, and inequality is the parent of motion, as
XIX. Such then is the statement for which I give my sentence, as we have briefly reasoned it out: that there are Being and Space and Becoming, three in number with threefold nature, even before the heavens were created. And the nurse of becoming, being made liquid and fiery and putting on the forms of earth and air, and undergoing all the conditions that attend thereupon, displays to view all manner of resemblances; and because she is filled with powers that are not similar nor equivalent, she is at no part of her in even balance, but being swayed in all directions unevenly, she is herself shaken by the entering forms, and by her motion shakes them again in turn: and they, being thus stirred, are carried in different directions and separated, just as by sieves and instruments for winnowing corn the grain is shaken and sifted, and the dense and heavy parts go one way, and the rare and light are carried to a different

we are informed in §8 A. Thus a vibratory motion is set up throughout the whole extent of the ὑποδοχή and communicated to the objects contained in it, which are thereby sifted as by a winnowing machine. This vibration of the ὑποδοχή and the πλασμα hereafter to be mentioned are the two most important physical forces in Plato's scheme; nearly all the processes of nature being due to them in one way or another.

9. κινουμένην δ' αἱ πάλν ἐκεῖνα σείειν] What Plato means by this action and reaction existing between the ὑποδοχή and its contents may thus be explained. If we abstract every sort of determination from sensuous perception, the residuum is space pure and simple. Now this, being without content, can of course have no motion. But once it is determined by the εἰσόντα καὶ ἐξίοντα, motion becomes possible; so that it is from these that the ὑποδοχή receives motive power. On the other hand the motion thus initiated has to obey the law of existence in space: i.e. (1) it is a φορά, or motion in respect of place, (2) it sifts the divers objects into different regions. Motion then begins with the εἰσόντα καὶ ἐξίοντα, but once begun it is controlled by the law of the ὑποδοχή. In starting motion with the εἰσόντα καὶ ἐξίοντα Plato distinctly intimates that there is no independent force in matter: therefore the πλασμανήματα cannot be regarded as an independent principle of causation.

10. πλάκανον] This was a kind of wicker sieve used for winnowing. Plato may have got the hint for his sifting motion from Demokritos: compare a fragment given by Sextus Empiricus adv. math. VII §§ 117, 118 καὶ γὰρ ἦν ὡμογενέσα ἔξωθα ἐξωγελάσται, οἷς περιστεραὶ περιστεραὶ καὶ ἄρανοι γεράνοι, καὶ ἕτεῖ τῶν ἄλλων ἀλόγων. ὁμαίστως δὲ καὶ περὶ τῶν ἄφόξων, κατάπερ ὅρθη πάρεστι ἐπὶ τέτων κοσμοκοιμομένων στερμάτων καὶ ἐπὶ τῶν παρὰ τῇς κυματωγῆς ψυφίδων· οἷον μὲν γὰρ παρὰ τὸν κοσμὸν διὸν διακριτῶς ψάκει μετὰ φακῶν τάσσονται καὶ κραθεῖ μετὰ κραθέων καὶ πνεύματα μετὰ πνεύμων· οἷον δὲ κατὰ τὴν τοῦ κύματος κίνησιν αἱ μὲν ἡμίμυκεσε ψυφίδες εἰς τοῦ αὐτόν τόπον τῇς ἑπιμυκέσεις ὑβάλωσιν, αἱ δὲ περιφέρεσι τῇς περιφέρεσι· οἷς ἐν εὐναγογῇ τῇ ἐχόσις τῶν πρηγμάτων τῆς ἐν τούτῳ ὁμοίωτητος.

Cf. Diogenes Laertius IX §§ 31, 32. As Mr Heath observes (Journal of Philology
éteran ἦκε φερόμενα ἐδραν τότε οὕτω τὰ τῇ τετταρά γενή σειόμενα ὑπὸ τῆς δεξαμένης, κινούμενης αὐτῆς οἷον ὄργανον σεισμόν παρέχοντος, τὰ μὲν ἀνομοίοτα πλείστον αὐτὰ ἀφ’ αὐτῶν ὁρίζειν, τὰ δὲ ὁμοίοτα μάλιστα εἰς ταύτων ἑξωθεῖν διὸ δὴ καὶ χώραν 5 ταύτα ἄλλα ἄλλην ἵσχεν, πρὶν καὶ τὸ πάν ἐξ αὐτῶν διακοσμηθὲν γενέσθαι. καὶ τὸ μὲν δὴ πρὸ τοῦτο πάντα ταῦτ' ἔχειν ἀλόγως καὶ ἀμέτρως· ὥστε δ’ ἐπεχειρεῖτο κοσμεῖσθαι τὸ πᾶν, πῦρ πρῶτον Β καὶ ὑδωρ καὶ γῆν καὶ ἀέρα, ἵνα μὲν ἔχουσα αὐτῶν ἄττα, παντάπασι γε μὴν διακείμενα ὡσπερ εἰκὸς ἔχειν ἄπαν, ὅταν ἄπῃ τινὸς 10 θεὸς, οὕτω δὴ τὸτε πεφυκότα ταύτα πρῶτον διεσχηματίσατο εἴδει τε καὶ ἀριθμοῖς. τὸ δὲ ᾽ἤ δυνατὸν ὡς κάλλιστα ἀριστά τε εξ οὐχ οὕτως ἔχοντος τὸν θεὸν αὐτὰ ἑξωστάναι, παρὰ πάντα ἡμῖν ὡς ἀεὶ τούτῳ λεγόμενον ὑπαρχέω· νῦν δ’ ὦν τὴν διάταξιν αὐτῶν ἐπι- χειρητέον ἐκάστων καὶ γένεσιν ἀήθει λόγῳ πρὸς ἥμας δηλοῦν, ἀλλὰ 15 γὰρ ἐπεὶ μετέχετο τῶν κατὰ παίδευσιν ὄδων, δὲ ὅν εἰδείκυσθαι τὰ λεγόμενα ἀνάγκη, ἑξωθεῖσθε.

viii p. 162), ‘it is remarkable that Plato sees the dynamical reason of the thing; while Democritus draws the fanciful and false inference that “like seeks its like”’.

2. ὑπὸ τῆς δεξαμένης] Stallbaum is unquestionably wrong in reading δεξαμενη, which means a cistern and nothing else: cf. Crit. 117 B.

5. πρὶν καὶ τὸ πάν} Plato’s meaning I take to be as follows. From the pluralisation of Being as such (the nature of Being remaining undefined) we get only the necessity of material perceptions: and all that is thereby necessarily involved is the existence of matter in some chaotic or rudimentary form. But when Being is defined to be Intelligence, the pluralisation of it must involve the ordering of matter according to some intelligent design. This metaphysical meaning Plato clothes in a mythical form borrowed from Anaxagoras. In this chapter he gives us a completion of Anaxagoras and a polemic against Demokritos. Anaxagoras, though he postulated νοῦς as a motive cause, failed to represent the uni-

verse as the orderly evolution of intelligence everywhere working ἐπὶ τὸ βέλτιστον: he confined himself to giving an account of the physical agencies through which he supposed νοῦς to work. Plato, in explaining these physical agencies, is careful to insist that they are merely subsidiary to the final cause: the real explanation of each thing is to be found in its motive. Demokritos held that the present order of the universe was the effect of a blind force working without intelligence, which by fortuitous collisions and combinations formed a symmetrical system. This view Plato controverts, urging that such fortuitous conjunctions could not amount to more than a rudimentary and chaotic condition of material existence: form, arrangement, symmetry imply intelligence in the motive power. Properly interpreted then, matter as it is πρὶν γενέσθαι τῶν ὀφειρῶν is matter evolved on the Demokritean plan as contrasted with the Platonic. Plato does not mean that there was a time when matter existed in this form.
place and settle there. Even so when the four kinds are shaken by the recipient, which by the motion she has received acts as an instrument for shaking, she separates the most dissimilar elements furthest apart from one another, and the most similar she draws chiefly together; for which cause these elements had different regions even before the universe was ordered out of them and created. Before that came to pass all these things were without method or measure; but when an essay was being made to order the universe, first fire and water and earth and air, which had certain vestiges of their own nature, yet were altogether in such a condition as we should expect for everything when God is not in it, being by nature in the state we have said, were then first by the creator fashioned forth with forms and numbers. And that God formed them to be most fair and perfect, not having been so heretofore, must above all things be the foundation whereon our account is for ever based. But now the disposition of each and their generation is what I must strive to make known to you in speech unwonted: but seeing ye are no strangers to the paths of learning, through which my sayings must be revealed to you, ye will follow me.

8. *αυτών ἀπο] This is an obviously certain correction of the senseless *αυτών *αιρα of the mss. Fire and the rest, before the universe was framed,—that is in a universe framed on the Demokritean theory—had some incipient indications of their present nature, but only in an inchoate condition.

9. ὁταν ἀπῇ τινάς θεός] i.e. in a world which is not the evolution of *θεός, but the result of mere chance and coincidence.

10. *εἰσιν τε καὶ ἀριθμοῖς] 'with forms and measures'; i.e. with bodies definitely qualified and quantified. ἀριθμοί has not the meaning it so frequently bears in Aristotle, 'the ideal numbers'; for this never occurs in the Platonic writings.

14. *ἄθει λόγω] Plato's expression is fully justified. When we come to examine his atomic theory (if so it may be called), we shall find it exceedingly peculiar and totally unlike any other that has ever been propounded.

15. *τῶν κατά παλιδευων ὄδων] Probably with especial reference to geometry, without some knowledge of which Plato's theory could not be comprehended. ὄδων is here practically equivalent to μεθόδων, a sense in which it is not unfrequently found; cf. *Phaedrus 263 b οὐκοίν τῶν μέλλοντα τέχνην βητορικόν μετέχει πρώτων μὲν δὲ ταύτα ὄδω οικοδομεῖαι: and *Cratylus 425 b ἄλλος δὲ συνείρειν μὴ φαίλοιν ὃ καὶ οὐ καθ' ὄδων.

53 c—55 c, c. xx. This is the generation of fire air water and earth. All these are solid bodies, and solid bodies are bounded by plane surfaces. Every rectilinear plane surface can be divided into triangles: the triangle then is the primary plane figure. The triangles which we affirm to be the fundamental form of all matter are two in number, the rectangular isosceles, and the rectangular scalene which is obtained by bisecting an equi-
XX. Πρωτον μὲν δὴ πῦρ καὶ ηemoth καὶ ὕδωρ καὶ ἀέρ ἢτι σωματα ἐστὶ, δὴλὸν που κἀ πατιν' τὸ δὲ τοῦ σώματος εἰδος πάν καὶ βάθος ἔχει· τὸ δὲ βάθος αὖ πᾶσα ἀνάγκη τὴν ἐπιτεδον περιειληφεῖαι φύσιν· ἢ δὲ ὀρθὴ τῆς ἐπιτεδον βάσεως ἐκ τριγώνων 5 συνεστηκε. τὰ δὲ τρίγωνα πάντα ἐκ δύνοιν ἄρχεται τριγώνων, δὲ μὲν ὀρθὴν ἔχοντος ἐκατέρον γωνίαν, τὰς δὲ δὲξεις· δὴν τὸ μὲν ἔτερον ἐκατέρωθεν ἔχει μέρος γωνίας ὀρθῆς πλευραῖς ὑπαίς διηρρήμενης, τὸ δ' ἔτερον ἄνλοιος ἄνωσα μέρη νενεμημένης. ταύτην δὴ πυρὸς ἄρχην καὶ τῶν ἄλλων σωμάτων ὑποτιθεμέθα κατὰ τὸν 10 μετ' ἀνάγκης εἰκότα λόγου πορευόμενοι· τὰς δ' ἐτι τούτων ἄρχας ἀνωθεν θεῶν οὐδὲ καὶ ἀνδρῶν ὅσ ἂν εκείνῳ φίλος ἦ. δεὶ δὴ λέγειν, ποια κάλλιστα σώματα γένοιτ' ἀν τέταρα, ἀνόμοια μὲν ἐαυτοῖς, ἐπιτεδον δὲ εὖ ἄλληλοιν αὐτῶν ἀττα διαλυόμενα γίγνεσθαι. τούτων γὰρ τυχόντες ἔχομεν τὴν ἀλήθειαν γενέσεως πέρι γῆς τε 15 καὶ πυρὸς τῶν τε ἀνὰ λόγου ἐν μέσῳ· τοῦτ' ἔτερον πορεύοντα, τὰ διαφέροντα κάλλει σωμάτων τέταρα γένη συναρμόσασθαι καὶ φάναι τὴν τούτων ἡμᾶς φύσιν ἰκανῶς εἰληφέναι. τοῦ δὴ δύνου τριγώνων τὸ μὲν 54 λ ὅν: δυνῶν Σ. 6 τὰς δὲ: τὰς δὲ δὔο Σ. 15 τόδε: τ' ἴση ΣΖ.

lateral triangle. From the latter the three elements fire air and water are framed: from the former earth alone. It follows then that while fire air and water can interchange and pass one into another, earth cannot pass into any of them nor they into it, because its base is different. But since the other three are formed on the same triangle, they can interchange, when a figure formed of many triangles breaks up into several formed of fewer, or vico versa. The way in which the figures are formed is as follows. Six of the primary scalenes placed together constitute an equilateral triangle; and four equilaterals form the sides of a regular solid, the tetrahedron or pyramid, which is the constituent particle of fire: eight such equilaterals are the sides of the octahedron, which is the particle of air: twenty equilaterals are the sides of the icosahedron, being the particle of water. These are all the forms constructed on the rectangular scalene. From the rectangular isosceles, by placing four together, is formed a square; and six squares are the sides of a fourth regular solid called the cube, which is the particle proper to earth. A fifth regular solid still exists, namely the dododecahedron, which does not form the element of any substance; but God used it as a pattern for dividing the zodiac into its twelve signs.

3. τὴν ἐπιτεδον] Every solid is bounded by plane surfaces. Aristotle, in criticising the Platonic theory (see de caelo III 1 298b 33; de gen. et corr. 1 ii 315b 30), objects (1) that you cannot make solid matter out of planes, (2) that there are no such things as indivisible magnitudes. To the first objection it is sufficient to reply that Plato, who was presumably as well aware as every one else of the impossibility of forming solids by an aggregation of mathematical planes, does not attempt to do anything of the
XX. In the first place, that fire and earth and water and air are material bodies is evident to all. Every form of body has depth: and depth must be bounded by plane surfaces. Now every rectilinear plane is composed of triangles. And all triangles are derived from two triangles, each having one right angle and the others acute: and one triangle has on each side a moiety of a right angle marked off by equal sides, the other has it divided into unequal parts by unequal sides. These we conceive to be the basis of fire and the other bodies, following up the probable account which is concerned with necessity: but the principles yet more remote than these are known but to God and to whatsoever man is a friend of God. Now we must declare what are the four fairest bodies that could be created, unlike one another, but capable, some of them, of being generated out of each other by their dissolution: for if we succeed in this, we have come at the truth concerning earth and fire and the intermediate proportionals. For we will concede to no one that there exist any visible bodies fairer than these, each after its own kind. We must do our diligence then to put together these four kinds of bodies most excellent in beauty, and so we shall say that we have a full comprehension of their nature.

Now of the two triangles the isosceles has but one kind, sort: to the second, that Plato's solids are not indivisible, but are the minutest forms of organised matter which exist. When they are broken up, they are either reformed into another figure, or the matter of which they are composed goes on existing in a formless condition. There is however a real difficulty not noticed by Aristotle, which will be discussed on 56 D. 4. ἐκ τριγώνων συνέστηκε] Because every rectilinear plane of whatever shape can be divided up into triangles, three straight lines being the fewest that can enclose a space.

5. ἐκ δύοιν ἄρχεται τριγώνων] All triangles are reducible to two, the rectangular isosceles and the rectangular scalene, because any triangle can be divided into one or other of these by simply drawing a perpendicular from one of the angles to the opposite side. Of the rectangular isosceles there is of course but one kind; of the rectangular scalene an endless variety. Out of these Plato chooses as best that which is obtained by bisecting an equilateral triangle; the reason for this choice becomes presently obvious.

10. τὰς δὲ ἐτὶ τοῦτων ἄρχας] Plato will not affirm that there is any physical ἄρχη which is absolutely ultimate.

13. αὐτῶν ἄττα] This anticipates the correction given in 54 B of the statement in 49 C.

15. τῶν τε ἀνὰ λόγον] i.e. the mean proportionals, air and water, between fire and earth; see 32 A.
1. τὸ δὲ πρόμηχες] i.e. the scalene. 
πρόμηχες denotes that one side exceeds the other in length: the word is applied to almost any shape which is longer than it is broad; in Theaetetus 148 A to a rectangle which is not a square; there and in Republic 54.6 c to a number expressing such a rectangle; to a long vault, Laws 947 D; to the elongated heads of beasts, Timaeus 91 E: στρογγύλα καὶ προσήχη = cylindrical, said of the spine, Timaeus 73 D.
6. ἐκ τριτοῦ συνέστηκεν] i.e. the two triangles combined form a third, which is equilateral.

The extreme ἀδῆθεα of Plato's theory will be at once seen by a brief comparison with those of his predecessors. Empedokles limited the primal elements to four and conceived them as indefinitely divisible; and he treats as primary those which Plato says are ὀδὸν ἐν συλλαβήσις εἴθεσιν. Anaxagoras reduces matter to qualitatively determinate corpuscles, infinitely numerous, infinitely various, and infinitely divisible. The atoms of Demokritos are infinite in number, indefinitely varying in size shape and weight, in other respects perfectly similar, and indivisible. Plato differs (1) in the derivation of his particles from his two primal triangles; (2) in limiting their varieties to four; (3) in assigning to these four certain specified geometrical forms; (4) in the peculiar conditions he imposes upon their divisibility; (5) in allowing two or more of the smaller particles to coalesce into one larger—this is directly contrary to the view of Demokritos; (6) in allowing within limits a diversity of size in the primal triangles, Plato seeks to explain differences of qualities which Demokritos ascribes to
but the scalene an endless number. Out of this infinite multitude then we must choose the fairest, if we are to begin upon our own principles. If then any man can tell of a fairer kind that he has selected for the composition of these bodies, it is no enemy but a friend who vanquishes us: however of all these triangles we declare one to be the fairest, passing over the rest; that namely of which two conjoined form an equilateral triangle. The reason it were too long to tell: but if any man convict us in this and find that it is not so, the palm is ready for him with our right good will. Let then two triangles be chosen whereof the substance of fire and of the other elements has been wrought; the one isosceles, the other always having the square on the greater side three times the square on the lesser. And now we must more strictly define something which we expressed not quite clearly enough before. For it appeared as though all the four classes had generation through each other and into each other, but this appearance was delusive. For out of the triangles we have chosen arise four kinds, three from one of them, that which has unequal sides, and the fourth one alone composed of the isosceles triangle. It is not then possible for all of them by dissolution to pass one into another, a few large bodies being formed of many small, and the converse: but for three of them it is possible.

varieties in the size and shape of the atoms; (7) whereas Demokritos insisted upon the necessity of void, Plato eliminates it so far as possible and makes no mechanical use of it; (8) though Plato agrees with Demokritos as to the sifting of like bodies into their proper region, he differs from him toto caelo on the subject of gravitation. There is moreover a still more fundamental peculiarity in the Platonic theory, which will be discussed later: see 56 6.

10. τρισχήν κατά δύναμιν] i.e. having the square on the longer side three times the square on the shorter.

Let $ABC$ be an equilateral triangle bisected by the perpendicular $AD$. Then the square on the hypotenuse $AC=(AD)^2+(DC)^2$. But $AC=2DC$, therefore $(AC)^2=4(DC)^2$; therefore $(AD)^2=3(DC)^2$, or $AD:DC::\sqrt{3}:1$. cf. Timaeus Locrus 98 A.

11. τό δή πρόστιθεν] Referring to the statement in 49 c that all the elements are interchangeable. Aristotle makes all four interchangeable: see for instance meteorologica 1 iii 339* 37 φαμέν δὲ πῦρ καὶ άέρα καὶ υδωρ καὶ γῆς γίνεσθαι εἰς ἀλλήλων, καὶ ἐκαστὸν ἐν ἑκάστῳ ὑπάρχειν τοῦ των διώκομει.
8. τὴν ὑποτεινούσαν] The same triangle given above, having its sides in the proportion \(1, \sqrt{3}, 2\).

9. ξύνοι δὲ] Take two equal rectangular scalenes \(AOF, AOE\), of the form aforesaid, and place them so that their hypotenuses coincide. Thus we have a trapezium \(AFOE\). In the same way form two other equal and similar trapeziums \(BFOD, CEOD\), and place them so that in each of them the two sides which are the shortest sides of the triangles coincide severally with a similar side in each of the two others, \(FO, EO, DO\). The juxtaposition of these three trapeziums gives us an equilateral triangle \(ABC\) formed of six rectangular scalenes similar in all respects to the triangle obtained by bisecting \(ABC\). For let \(ABC\) be an equilateral triangle, and draw the three perpendiculars \(AD, BE, CF\) each bisecting it. Then it is easy to prove that the three perpendiculars intersect in the point \(O\): and since in the triangle \(AOF\) the angle \(AFO\) is a right angle and the angle \(FAO\) is \(\frac{1}{3}\) of a right angle, therefore the angle \(AOF\) must be \(\frac{2}{3}\) of a right angle; and the triangle \(AOF\) is consequently similar to \(ADB\), as also are the other five. Accordingly the juxtaposition of six rectangular scalenes of the form and in the manner described will make up a single equilateral triangle.

κατὰ διαμέτρον] That is, placed so that the hypotenuse of one coincides with that of the other: the common hypotenuse \(AO\) of the two triangles \(AOF, AOE\) becomes the diagonal of the trapezium \(AFOE\).

11. εἰς ταύτων ὡς κέντρον] i.e. at the point \(O\).

12. ἐς ἕς τῶν ἄρθρων] It is notable that Plato uses six of the primary scalenes to compose his equilateral triangle, when
For since they all arise from one basis, when the larger bodies are broken up, a number of small ones will be formed from the same elements, putting on the shapes proper to them; and again when a number of small bodies are resolved into their triangles, they will become one in number and constitute a single large body of a different form. So much for their generation into one another: the next thing will be to say what is the form in which each has been created, and by the combination of what numbers. We will begin with the form which is simplest and smallest in its construction. Its element is the triangle which has the hypotenuse double of the shorter side in length. If a pair of these are put together so that their hypotenuses coincide, and this is done three times, in such a way that the hypotenuses and the shorter sides meet in one point as a centre, thus one equilateral triangle has been formed out of the other six triangles: and if four equilateral triangles are combined, so that three plane angles meet in a point, they make at each point one solid angle, that which comes immediately next to the most obtuse of plane angles; and when four such angles are produced there is formed the first solid figure, dividing its whole surface into four equal and similar

he could have done it equally well with two. Similarly he uses four rectangular isosceles to compose the square, whereas he could have formed it of two. The reason is probably this: the sides of the primary triangles mark the lines along which the equilaterals are broken up in case of dissolution. Now had Plato formed his equilaterals of two scalenes only, it would have been left in doubt whether the triangle $ABC$ would be broken up along the line $AD$, or along $BE$, or $CF$. But if they are composed of six, the lines along which dissolution takes place is positively determined; since there is only one way in which six can be joined so as to form one equilateral. The same remark applies to the composition of the square. Also by taking one-sixth of the equilateral, instead of one-half, we get the smallest element possible for our primal base.

12. τριγώνα δὲ ἵσοπλευρά] Next we take four equilateral triangles thus constructed each of six elementary scalenes, and place them so as to make a regular tetrahedron or pyramid; each of whose solid angles is bounded by three planes meeting in a point. The pyramid is the simplest of the regular solids, having four equilateral triangles for its sides, and therefore containing 24 of the primal scalenes. This is the corpuscule composing fire.

13. τῆς ἀμβλυτάτης] The most obtuse plane angle (expressed in integral numbers) is 179 degrees, one degree short of two right angles, or a straight line. The solid angle of a pyramid is, as we have seen, bounded by three equilateral triangles. The angle of an equilateral triangle is two-thirds of a right angle, that is, 60 degrees. Therefore the angle of the pyramid contains 180 degrees, or

13—2
one degree more than the obtusest possible of plane angles.

2. ἵσσόπλευρα τρίγωνα ὑκτὸν] The next figure is the octahedron, the second regular solid, having eight equilateral triangular sides, and six angles, each of them bounded by four faces: this then contains 48 of the primal scalenes. This is the constituent corpuscle of air.

4. τὸ δὲ τρίτον] The third regular solid is the icosahedron, which has twenty sides, of the same shape as the former, and twelve angles, each bounded by five of the equilateral planes; this consequently contains no less than 120 primal scalenes. This forms the element of water. And now the rectangular scalene, out of which the equilateral is formed, has finished its work: since these three are the only regular solids whose sides are equilateral triangles.

9. κατὰ τέταρτα ἕννσταμένον] The corpuscle of which earth is formed is based upon the other element, the rectangular isosceles: four of which, joined in the manner shewn in the accompany-

ing figure, make a square. Six of these squares set together form the fourth regular solid, which is the cube, having eight equal angles each bounded by three planes: the cube then contains 24 of the elementary isosceles. The reason why Plato forms his square of four instead of two triangles has been already suggested: it is obvious however that he might have constructed it of any number he chose: for by bisecting the triangle $AOB$ we should obtain two precisely similar triangles, which again might be bisected into precisely similar triangles usque ad infinitum. Plato however had to stop short somewhere in the number of triangles which he assigned to the square; and naturally enough he stopped short at the smallest number which gave him
parts. The second is formed of the same triangles in sets of eight equilateral triangles, bounding every single solid angle by four planes; and with the formation of six such solid angles the second figure is also complete. The third is composed of 120 of the elementary triangles united, and of twelve solid angles, each contained by five plane equilateral triangles; and it has twenty equilateral surfaces. And the first element, when it had generated these figures, had done its part: the isosceles triangle generated the fourth, combined in sets of four, with the right angles meeting at the centre, thus forming a single square. Six of these squares joined together formed eight solid angles, each produced by three plane right angles: and the shape of the body thus formed was cubical, having six square planes for its surfaces. And whereas a fifth figure yet alone remained, God used it for the universe in embellishing it with signs.

determinate lines of cleavage.

14. ἂν δὲ οὖντις ἐξοστάσεως μᾶς περιπτῆς] There is in existence yet a fifth regular solid, the dodecahedron. This has twelve sides, each of which is an equilateral pentagon; it has twenty solid angles each contained by three planes. This is of course not based upon either of the elementary triangles; nor is it the corpuscle of any material substance. God, says Plato, used it for a pattern in diversifying the universe with signs: that is it served as a model for the twelvefold division of the zodiac. The writer of the Timaeus Locus (see 98 E τὸ δὲ δωδεκάεδρον εἶκόνα τοῦ παντὸς ἐστάσατο, ἐγγιστα σφαίρας ἑνὸ) is quite in error in supposing that the shape of the dodecahedron has anything to do with that of the universe: the spherical shape of the latter is the material symbol of the ens χών. Plato was bound to find some significance for the only remaining regular solid; and he found it as suggesting the twelve signs of the heavens. Compare Plaeno 110 B πρῶτον μὲν εἶναι τοιαῦτα ἢ γῆ τοῦτο ἢθεν, εἰ τις ἄνεθεν δεύτερον, ὡσπερ αἱ δωδεκάκυκλοι σφαῖραι, where obviously the 'twelve-patched ball' represents the duodenary division. There is a curious blunder in Plutarch quaestiones platonicae v i: συνήρμοσαι δὲ καὶ συμπέπηγεν ἐκ δώδεκα περταγώνων ἴσους πλεύρας καὶ ἴσους πλευρῶν, ἵνα ἐκαστὸν ἐκ τριάκοντα τῶν πρῶτων σκαληνῶν τριγώνων συνέσηκη διὸ καὶ δοκεῖ τὸν ἴσοιακὸν ἄμα καὶ τὸν ἐνιαυτὸν ἀπομεῖαθαι ταῖς διαυομαῖς τῶν μοιρῶν ἱσαρίθμως οὖν. Alkinoos has a similar statement: this would involve the consequence that every side of the dodecahedron can be divided into five equilateral triangles, each consisting of six primal scalenes; an opinion which Stallbaum welcomes with joy, saying that it 'mirifice convenit' with the 360 degrees into which the circle is divided. It is perhaps strange that neither Stallbaum Plutarch nor Alkinoos took the trouble even to draw a regular pentagon in order to verify this theory, which is of course geometrically absurd: Martin goes so far as to give, not without sarcasm, a mathematical demonstration of its impossibility.

55 c—56 c, c. xxi. Now if the question be put, are there more cosmical systems than one? the reply that there are an indefinite number would be a very in-
XXI. Ἄ δὴ τις εἰ πάντα λογιζόμενος ἐμμελῶς ἀποροῖ, πότερον ἀπείρους χρή κόσμους εἶναι λέγειν ἢ πέρας ἔχοντας, τό μὲν ἀπείρους ἔγραψεν ἂν ὄντως ἀπείρου τινὸς εἶναι δόγμα διὸν ἐμπειροῦχον χρεῶν εἶναι πότερον δὲ ἦν ἡ πέντε αὐτῶς ἀληθεία πεφυκτάς λέγειν προσήκει, μᾶλλον ἂν ταῦτα στὰς εἰκότως διαποτῆσαι. τὸ μὲν οὖν δὴ παρ᾽ ἡμῶν ἦν αὐτὸν κατὰ τὸν εἰκότα λόγον πεφυκτάς μηνύει, ἀλλος δὲ εἰς ἄλλα πη βλέψας ἔτερα δοξάσει. καὶ τούτων μὲν μεθετέουν, τὰ δὲ γεγονότα νῦν τῷ λόγῳ γένη διανείμομεν εἰς τῦρ καὶ γῆν καὶ ὠδίων καὶ ἀέρα. ἢ μὲν δὴ τὸ κυβικὸν εἴδος δομεῖ ἀκινητοτάτη γὰρ τῶν τετράγων γενόν γῆ καὶ τῶν Εὐκόσμων πλαστικότατη, μάλιστα δὲ ἀνάγκη γεγονεῖν τουσιόν τὸ τάς βάσεις ἀσφαλεστάτας ἔχουν βάσεις δὲ ἦ τε τῶν καὶ ἀρχαῖς τριγώνων ὑποτεθέντων ἀσφαλεστέρα κατὰ φύσιν, ἡ τῶν ἱσών

5 ποτὲ post λέγειν dat Α, quod inclusum retinet H. cum SZ cieci. 7 ὀδ.: πᾶς S. 8 τοῦτον: τοῖτων SZ.

definite answer: but to affirm that there are five might be more reasonable. We however in conformity with our principles assert that there is but one. We must now assign our elementary solids to the natural substances which they severally compose. Earth is the most unyielding of the four; therefore to it we assign the cube as its constituent; for this is the most stable solid, being formed of the rectangular isosceles. To water, which next to earth is the most sluggish, we give the icosahedron; and to fire, which is of all the most mobile, the pyramid; while for air there remains the intermediate form of the octahedron. Now all these corpuscles are separately so small as to be invisible; it is only when they are collected in large numbers that they can be seen by us: but God assigned them to the four substances with due regard to proportion in respect of multitude and motion and all other powers.

3. ἀπειρούσ...ἀπειροῦν] For the play on the word compare Philebus 17 κ τὸ δὲ ἀπείρον σε ἐκάστων καὶ ἐν ἐκάστος πλήθος ἀπειροῦν ἐκάστοτε ποιεῖ τῶν φρονεῖν καὶ εὖκ

εἴλημενον ὁδὸν ἐνάρμιον, ἢτιν' εἰς ἀριθμὸν οὐδένα ἐν ὀνομα πάστε ἀπόδεικτον, Plato is at issue with Demokritos, who consistently with his whole physical theory maintained that the number of κόσμοι was infinite: Plato is equally consistent in affirming that there is only one. The oddest fancy in this way is one ascribed by Plutarch de defectu oraculorum § 22 to Petron of Himera, who declared there were 183 κόσμοι, disposed in the form of an equilateral triangle. The eternal fitness of this arrangement is not explained by Plutarch.

4. πότερον δὲ ἦν ἡ πέντε] Plato regards as a comparatively reasonable supposition the view that there may be five κόσμοι, because there exist in nature five regular rectilinear solids. Compare Plutarch de ei apud Delphos § 11 πολλὰ δ᾽ ἄλλα τουσιόν, ἐφικέν ἑγὼ, παρελθών, τῶν Πλάτωνα προσάξαμεν λέγοντα κόσμον ἑνα, ὡσ εἴπερ εἴολ παρὰ τούτον ἐτέροι καὶ μὴ μόνον νότος εἰς, πάντε τοὺς πάντας ὄντας καὶ μὴ πλεονασ. οὐ μὴν ἄλλα κἀν εἰς οὕτων ὑ ὑπογεγένητο, ὡσ περὶ καὶ Ἀριστοτέλης, τριτά τινα καὶ τούτων ἐκ πέντε συγκείμενον κόσμον καὶ συνημμοσμένον
XXI. Now if any man, reflecting upon all these things, should fairly ask himself whether the number of cosmic systems is indefinite or definite, he would deem that to believe them indefinite was the opinion of one who thought very indefinitely οὖν a matter where he ought to be most definitely informed: but whether we ought to say that there is but one, or that there are really in nature five, he might, if he stopped short there, with more justice feel doubtful. Our verdict declares that according to the probable theory it is by nature one; another however, looking to some other guide, may have a different view. But no more of him; let us assign the figures that have come into being in our theory to fire and earth and water and air. To earth let us give the cubical form; for earth is least mobile of the four and most plastic of bodies: and that substance must possess this nature in the highest degree which has its bases most stable. Now of the triangles which we assumed as our starting-point that with equal sides is more stable than that

It will be noted that here, where he is dealing with physics and the region of opinion, Plato only pronounces the unity of the universe to be probable and consonant to his theory of nature. But at 31 B it is authoritatively declared to be one on the inofflible principle of metaphysical necessity. After μηρότει, θεὸς cannot possibly be genuine.

7. ἄλλος δὲ εἰς ἄλλα την] Obviously aimed at Demokritos: a philosopher who has no place for νοῦς in his system may very well maintain an infinity of κόσμων.

8. τοῦτον] i.e. Demokritos, who is dismissed with something more like contempt than Plato is wont to show for other thinkers.

7. τά δὲ γεγονότα τῶν τῷ λόγῳ] Compare 27 Α ἀνθρώπου τῷ λόγῳ γεγονότας.

11. πλαστικωτάτη] The other three are too subtle to be plastic. Aristotle’s objections to the present theory will be found in de caelo III viii 306b 3: they are not for the most part very forcible. The most pertinent is that of Plato’s geometrical figures only the pyramid and the cube can fill up space continuously: the
πλευρῶν, τῆς τῶν ἀνύσων, τὸ τε ἔξ ἐκατέρου ξυντεθὲν ἐπίπεδον ἱσόπλευρον ἱσοπλεύρῳ τετράγωνον τριγώνον κατὰ τε μέρη καὶ καθ’ ὅλων στασιμωτέρως ἐξ ἀνάγκης βέβηκε. διὸ γὰρ μὲν τὸν ἀπονέμοντες τὸν εἰκότα λόγον διασφόραμεν, ὡδαὶ δ’ αὖ τῶν λουπόν 56 A 5 τὸ δυσκινητῶτατον εἶδος, τὸ δ’ εὐκινητῶτατον πυρί, τὸ δὲ μέσον ἀέρι καὶ τὸ μὲν σμικρῶτατον σῶμα πυρί, τὸ δ’ αὖ μέγιστον ὡδαί, τὸ δὲ μέσον ἀέρι καὶ τὸ μὲν ἐξύτατον αὖ πυρί, τὸ δὲ δεύτερον ἀέρι, τὸ δὲ τρίτον ὡδαί. ταῦτ’ οὖν δὴ πάντα, τὸ μὲν ἔχουν ὀλυγίστας βάσεις εὐκινητῶτατον ἀνάγκη πεφυκέναι, τμητικὸτατον τε 10 καὶ ἐξύτατον ὑπὸ πάντη πάντων, ἔτει τε ἐλαφρῶτατον, ἔξ ὀλυγίστων B ἐξυνεστὸς τῶν αὐτῶν μερῶν τὸ δὲ δεύτερον δευτέρως τὰ αὐτὰ ταῦτ’ ἔχειν, τρίτως δὲ τὸ τρίτον. ἔστω δὴ κατὰ τὸν ὅρθον λόγον καὶ κατὰ τὸν εἰκότα τὸ μὲν τῆς πυραμιδος στερεῶν γεγονὸς εἶδος πυρὸς στοιχεῖον καὶ σπερμα. τὸ δὲ δεύτερον κατὰ γένεσιν εὑπω-15 μὲν ἀέρος, τὸ δὲ τρίτον ὡδατος. πάντα οὖν ὅ ὡδατα δεὶ δια- νοεῖσθαι σμικρὰ ὅρτως, ὅς καθ’ ἐν ἐκαστοῦ μὲν τοῦ γένους ἐκάστου διὰ σμικρότητα οὐδὲν ὄραμενον ὑφ’ ἡμῶν, ξυναθροισθέντων δὲ σ πολλῶν τοὺς ὄγκους αὐτῶν ὀράσθαι καὶ δὴ καὶ τὸ τῶν ἀνάλο- γων περὶ τε τὰ πλῆθη καὶ τὰς κινήσεις καὶ τὰς ἄλλας δυνάμεις 20 πανταχῶ τὸν θεὸν, ὁππερ ἢ τῆς ἀνάγκης ἐκούσα πεισθεῖσα τε

8 ὀλυγίστας: ὀλγας τὰς Α. ὀλγοστάς S. 10 καὶ ante ἐξύτατον omittit S.
14 εἴπομεν: εἴπομεν A.

bearing of this will be discussed a little later; see note on 58 A.

2. κατὰ τε μέρη καὶ καθ’ ὅλων i.e. as the rectangular isosceles is more stable, owing to the equality of its sides, than the rectangular scalene, so the solid based on the former is more steady than that based on the latter.

6. τὸ μὲν σμικρῶτατον] No comparison in point of size is made with the corpuscles of earth, because the latter has a different base: but in the case of the other three the size of the figure varies according to the number of the radical triangles contained in it.

8. ὀλγοστάς βάσεις] Stallbaum seems perverse in reading ὀλγοστάς. For even if ὀλγοστάς could mean ‘very small’ (which is quite dubious: see Campbell on Sophokles Antigone 625), this is not the right meaning; the sense requires ‘very few’: for the mobile and penetrating nature of fire is due to the small number of its sides and the consequent acuteness of its angles. Plato evidently considers that the sharp points of the pyramid most readily cleave their way through other bodies; and so Aristotle understood him to mean, de caelo III viii 307a 2. It is curious to observe how the meaning of πολλοστάτω affirms and of ὀλγοστάς sometimes seems to be inverted: compare the passage of the Antigone aforesaid, πράσινο δ’ ὀλγοστάν χρώνων ἐκτὸς ἄτα (v. 1. ὀλγοστών) with Demosthenes κατὰ Τμικράτων § 196 τὸ τὰ τοῦτον πολλοστῷ χρῶν ψῆλος καὶ ἐκοντα...κατατείναι. In the first case the meaning will be ‘he is free from woe for a time which is one of a few (sc. of a few times when he is free)’; i.e. he is
with unequal; and of the surfaces composed of the two triangles the equilateral quadrangle necessarily is more stable than the equilateral triangle, both in its parts and as a whole. Therefore in assigning this to earth we preserve the probability of our account; and also in giving to water the least mobile and to fire the most mobile of those which remain; while to air we give that which is intermediate. Again we shall assign the smallest figure to fire, and the largest to water and the intermediate to air: and the keenest to fire, the next to air, and the third to water. Now among all these that which has the fewest bases must naturally in all respects be the most cutting and keen of all, and also the most nimble, seeing it is composed of the smallest number of similar parts; and the second must have these same qualities in the second degree, and the third in the third degree. Let it be determined then, according to the right account and the probable, that the solid body which has taken the form of the pyramid is the element and seed of fire; and the second in order of generation let us say to be that of air, and the third that of water. Now all these bodies we must conceive as being so small that each single body in the several kinds cannot for its smallness be seen by us at all; but when many are heaped together, their united mass is seen: and we must suppose that the due proportion in respect of their multitude and motions and all their other powers, when God had completed them with all perfection, in so far as the nature of necessary agreement with Demokritos, in making his atoms so small as to be individually invisible, and only perceptible in masses.

18. τὸ τῶν ἀναλογίων] That is to say, observing the proportional relations compounded in 32 A, B.

20. πισθεῖσα] cf. 48 A. ξυνηρμόθαι is sometimes regarded as an anacoluthon; but there can be hardly a doubt that it is a middle. The middle of this word is used twice elsewhere by Plato, each time in the aorist: see above 53 ἐ σωμάτων τέταρτα γένη συνηρμοθαί, and Politicus 309 C θεῖο ξυνηρμοσαμένη δεσμοῖ.

56 c—57 D, c. xxii. When earth then is resolved by fire, it drifts about until it can reunite with earthy elements, and so
resume the form of earth; for, owing to the
dissimilarity of base, it cannot be
changed to any of the other three. But
when water is resolved by fire or air, it
can be reformed in the shape of fire and
air. So when air is resolved, one of its
particles make two of fire, or two particles
and a half form one of water. Of fire
also two particles may coalesce into one
of air. And, in general, when a smaller
mass of any of the three is overcome by a
larger mass of any other and resolved, its
resolution ceases the moment it assumes
the form of the victorious element, but
not until then. So the vanquished ele-
ment must either escape away and seek
its own region in space, or else accept
the form of the other. It follows then
that, owing to this incessant conflict be-
tween the elements, perpetual changes of
form are taking place, and perpetual
changes of position in space.

All this has been said in view of the
primary and typical kinds in the four
forms, fire, air, water, earth: but a variety
of kinds are found within the limits of
each form. These are due to a variation
of size in the primal triangles, of which
there are so many sizes as there are kinds
in each form. Such kinds by manifold
intermixture produce an endless number
of varieties in phenomena, which it is our
business to investigate.

5. φέροντ' ἄν] Earth has not the
alternative, which is open to the other
three, of coalescing with the dominant
element: it must therefore drift about in
a chaotic condition, until it can escape
into its own place and so regain its proper
form.

6. ἢν ἄν ἄρος] The form of this
sentence suggests that the dissolution
takes place by the agency of fire within
a mass of air or of water. But clearly
the same result follows whether the agent
be fire air or water.

9. ἔστάντα] Ast and Stallbaum would
read ἔστάν. But ἔστάν agrees, by an
easy attraction, with ἦν μὲν δόξα δὲ follow-
ing. It might be considered however
that, since the single particle of water is
resolved into two of air and one of fire,
διαλυθέντα would be more correct than
ἔστάντα. Plato’s word however is per-
fectly accurate, if his theory be rightly
understood. And this leads to a discussion
of the chief peculiarity and difficulty of
that theory.

First then Aristotle de caelo III i 299b 1
brings against it the fundamental ob-
jection that it is impossible to form solid
matter out of mathematical planes. Now
it is entirely preposterous to suppose that
the most accomplished mathematician of
his time was not fully alive to a truth
which, as Aristotle himself admits, ἔστι-
νολὴς ἔστιν ἰδέων. The theory of an over-
sight in this respect must therefore be
sity, consenting and yielding to persuasion, suffered, were everywhere by him ordained in fitting measure.

XXII. From all that we have already said in the matter of these four kinds, the facts would seem to be as follows. When earth meets with fire and is dissolved by the keenness of it, it would drift about, whether it were dissolved in fire itself, or in some mass of air or water, until the parts of it meeting and again being united became earth once more; for it never could pass into any other kind. But when water is divided by fire or by air, it may be formed again and become one particle of fire and dismissed out of hand. Howbeit, if we regard these geometrical figures as solid bodies which interchange their forms, they will not produce the combinations required. For instance, the apposition of two pyramids will not produce an octahedron, as it ought according to Plato, but an irregular six-sided figure: and by dividing the octahedron we obtain not a regular tetrahedron, but a five-sided figure having four equilateral triangles meeting in the apex, and a square for the base. Similarly the icosahedron refuses to play its prescribed part. Again it is incredible that Plato was unaware or oblivious of these elementary facts.

Martin has a theory so neat and ingenious that, although I do not see my way to accepting it, yet it ought not to be left unnoticed. His view is that Plato’s ἐπίπεδα are not mathematical planes at all, but thin laminae of matter, ‘feuilles minces taillées suivant les figures rectilignes qu’il a décrites.’ Thus our four geometrical figures are not solid bodies, but merely envelopes or shells, void within. In this way no doubt Plato’s transformations would be perfectly practicable. Supposing that an octahedron were shattered κατὰ τὰ τρέγωνα, then its eight triangular sides would be recomposed in the form of two pyramids; and all the other transmutations would be equally feasible. This explanation, despite its ingenuity, is nevertheless not to my mind satisfactory. For Plato eli-
stitution of matter: they are definite forms under which space by the law of nature appears in various circumstances. The planes are real planes; but they do not compose the solid; they merely express the law of its formation. Given certain conditions, the geometrical law obtains that matter shall receive form as pyramids; alter the conditions, e.g. increase the pressure, and the pyramids disappear, their place being taken by octahedrons; and so forth. It is not then that two of the former particles have combined to make one of the latter, but that the matter in its new condition assumes a shape in which the radical form, the rectangular scalene, appears twice as many times as in the former. Increase the pressure again, and the triangle will appear five times as often as in the first. And if the triangles are equal, the second and third contain twice and five times as much stuff as the first. In short, when matter which has been existing in the pyramidal form is prevented from doing so any longer, it must not assume any random figure, but one which is constructed on either twice or five times as many primal triangles as the pyramid. The επισέβα then are, I believe, neither to be regarded with Aristotle as planes out of which we are expected to construct solids, nor with Martin as thin solids; but as the law of the structure of matter. Thus, instead of having two or more corpuscles combined into one, or one resolved into several, we have the whole mass fused, as it were, and re-moulded. This interchange however can only take place where the law of formation is one and the same. Earth, obeying a different formative law, cannot go beyond one sole form. For matter which has once been impressed with either of the primal figures can never pass into the other figure: in the rudimentary condition to which it is reduced by the fracture of its particles, the force which forms it as a pyramid or a cube is in abeyance, but not the law which impressed it with the rectangular scalene or the rectangular isosceles.

On this showing then the correctness of ξυστάσα is clear: though I admit it is equally justified by Martin’s hypothesis, could the objections which I have urged against the latter be overcome.

1. ἐν μὲν πυρός] The sides of the
two of air: and the divisions of air may become for every particle broken up two particles of fire. And again when fire is caught in air or in waters or in earth, a little in a great bulk, moving amid a rushing body, and contending with it is vanquished and broken up, two particles of fire combine into one figure of air: and when air is vanquished and broken small, from two whole and one half particle one whole figure of water will be composed. Let us also reckon it once again thus: when any of the other kinds is intercepted in fire and is divided by it through the sharpness of its angles and its sides, if it forms into the shape of fire, it at once ceases from being divided: for a kind which is uniform and identical, of whatever sort it be, can neither be the cause of any change nor can it suffer any from that which is identical and uniform with itself; but so long as passing into another kind a lesser bulk contends with the greater, it ceases never from being broken. And when the

icosahedron, being 20 in number, are equal to the sum of the sides of two octahedrons and one pyramid.

2. καλ πάνω] Having given instances of smaller corpuscles arising from the resolution of larger, Plato now passes to the formation of larger particles from the resolution of smaller.

4. καταβράνσθη] This is the converse of ἔνσταντα above: the pyramids, being the smallest particle, could not literally be ‘broken up’ into the larger bodies. The same applies to κατακερματισθέντος ἄδροι below.

7. ὄδε γάρ δὴ λογισάμεθα] Having set forth the rules governing the transition of one kind of particle into another, Plato proceeds to point out that, when one element is overpowered by another, the only mode in which it can recover any form, in default of escape to its own region, is to assimilate itself to the victorious body.

9. κατά τάς πλευράς] i.e. cleft by the sharp edges of the sides.

10. τὸ γὰρ ὀμοιον] This view was universally held, with the sole exception of Demokritos: cf. Aristotle de gen. et corr. I vii 323b 3 1 the γὰρ πλείουτο τοῦτό γε ὁμοιοτικῶς λέγονται, ὅταν τὸ μὲν ὄμοιον ὑπὸ τοῦ ὀμοίου πᾶν ἀπαθὸς ἑστι διὰ τὸ μηδὲν μᾶλλον ποιητικὸν ἢ παθητικὸν εἶναι διότερον διὰτερόν (πάντα γὰρ ὀμοίως ὑπάρχειν παῦτα τοῖς ὀμοίοις), τὰ δ' ἀνέμοια καὶ τὰ διάφορα ποιεῖν καὶ πάσχειν εἰς ἄλλα ἀνεύρεται. ...Δημόκριτος δὲ παρὰ τοὺς ἄλλους ἠθὼς ἔλε∫ε μόνοι· φησί γὰρ τὸ αὐτὸ καὶ ὀμοίον εἶναι τὸ τε ποιεῖν καὶ τὸ πάσχειν· οὐ γὰρ ἐγχειρεῖν τὰ ἐτερα καὶ διαφέρουσα πᾶσχειν ὑπ’ ἄλλα, ἀλλὰ κἂν ἐτερα διά τινα ποιῇ τε ἐν ἄλλα, οὐκ ἐτερα, ἀλλ’ ταῖς τυπαρχεῖς, ταύτη τοῦτο συμβαίνειν αὐτοῖς. Theophrastos however considers that the view of Demokritos is uncertain: see de sensu § 49. This doctrine of μηδὲν παθεῖν τὸ ὀμοίον ὑπὸ τοῦ ὀμοίου only refers to physical change, and does not affect the principle ‘like is known by like’.

14. τὰ τε αὖ σμικρότερα] There seems at first sight a good deal of iteration in this chapter; but there is no real tautology. Plato (1) explains how (a) the larger figures are dissolved by the smaller, (b) how the smaller are dissolved by the larger; (2) he declares that (a) a small mass of the larger figures, intercepted by

a large mass of the smaller, (β) a small mass of the smaller, intercepted by a large mass of the larger, can recover a definite form by becoming assimilated to the victorious element.

4. éan ð eis auûta [ø] The case put here seems to differ from the foregoing in this. Hitherto we have supposed a small mass of one kind intercepted by a large mass of the other; now we take the case of a prolonged struggle between pretty equal forces, when the process of dissolution continues without intermission, until one side is vanquished and either escapes away or is assimilated.

6. õv õk polloûv] This ensues of course only if the victorious side is the kind formed of the larger figures.

8. diaymeìsettai tàs õxhòras] Any kind by changing its figure changes the region of its affinity, as will be explained in the following chapter.

9. tà plèbhi] i.e. the main bulk of the substance. Detached portions of every kind may from various causes be found scattered everywhere through space, but the great mass of each is in its own region: cf. 63 B ov kai plèstov õv ðòrôoumèvou õeì pròs ð fírèta.

10. tìn tûs ðexeoméveta kîmësi] The vibration of the õòdòxh described at 52 E.

13. ôsa õmè ouv àkrrata kai pròta sómata] i.e. the primary and typical forms of the four so-called elements. Hitherto we have been dealing merely with the broad distinctions between fire, air, water, and earth. We shall hereafter find it necessary to treat of a number of different varieties. These diversities are accounted for by a diversity in the magnitude of the primary triangles.

17. óòàper õv õv tòv tòis õìdeisîv gévnì] The õìdos of course signifies some one of the four, as distinguished from the other three; say fire. There are a certain number of sizes in the radical triangles, and consequently an equal number of
smaller figures few in number are caught in a multitude of larger figures and are being broken in pieces and quenched, if they consent to combine into the form of the stronger they then and there cease from being quenched; and from fire arises air, from air water. But if they assail the others, and another sort meet and contend with them, they cease not from being shattered until, being entirely repelled and dissolved, they find refuge with some of their own kind, or being overcome, form from many of their own figures one similar to the victorious element, and there remain and abide with it. Moreover on account of these conditions they all are changing their places; for the bulk of every kind are sorted into separate regions of their own through the motion of the recipient: and those which are altered from their own nature and made like some other are carried by reason of this movement to the region proper to the element to which they are assimilated.

All unmixed and primary bodies have thus come into being through the causes we have described: but for the fact that within the several classes different kinds exist we must assign as its cause the structure of the elementary triangles; it does not originally produce in each kind of triangle one and the same size only, but some greater and some less; and there are just so many sizes as there are kinds in the classes: and when these sizes in the pyramid. Now every substance which is composed entirely from pyramids of some one size constitutes a γένος of fire; there are therefore just so many γένος of fire as there are sizes of pyramids. But there are also substances which are composed of pyramids of different sizes: such substances will not be typical of any γένος, but will approximate to some γένος according as any special size of pyramid preponderates in its fabric. Accordingly we have in nature an indefinite number of substances belonging to each εἶδος, graduating from one γένος to another. The investigation of these begins in chapter xxiv. It is obvious that the variation in the size of the triangles must be confined within definite limits, for the largest pyramid is always smaller than the smallest octahedron, and the largest octahedron than the smallest icosahedron—for instance we find in 66 D that the φίλόδες of the nostrils are too wide for the densest form of air and too narrow for the subtlest form of water.

57 D—58 C, c. xxiii. Our discourse now requires that we should set forth the causes of rest and motion. Motion implies the mover and the moved, without which two it cannot be. These two must be dissimilar; therefore dissimilarity is an essential condition of motion. And the cause of dissimilarity is inequality. Now the reason why all things are not sifted once for all into their proper regions and so become at rest is as follows. The whole globe of the universe is subject to a mighty constricting centripetal force,
which crushes its whole mass together and will not suffer any vacant space within it. This forces the subtler elements into the interstices of the coarser; and so by the admixture of larger and smaller forms, dilation and compression is everywhere at work; thereupon ensues the transmutation of one element into another, and by consequence a change of its proper region to which it tends. Thus a perpetual shifting of forms ensures a perpetual shifting of place.

3. κινήσεως οὖν] Concerning motion Plato sets forth in this chapter (1) whence it originates, (2) why it never ceases.

6. ἐν μὲν ὀμαλότητι] We saw above at 57 A that like could not affect like nor be affected by it: it follows then that in a perfectly uniform mass motion cannot arise, since motion is the effect of a moving cause upon the object moved. The kowtou then and kinkosmenou must be ἀνώμαλα, heterogeneous.

10. ἐν ὀμαλότητι...εἰς ἀνωμαλότητα] Rest exists in uniformity, motion is attributed to dissimilarity: thus we may express the change of preposition.

12. ἀνισότητος δὲ γένεσιν] How inequality originates we have seen in the account of the structure of matter. It arises (1) from the dissimilarity of the two primal triangles, (2) from the different geometrical figures which are based upon one of the triangles, (3) from inequality in size of the triangles themselves.

πῶς δὲ ποτέ οὐ κατὰ γένη] This sentence is misunderstood by Lindau and Stallbaum. Plato means to explain how it is that the four ἔδη have not settled each in its proper sphere, and thus avoided interfering with each other and so producing irregularity and consequently motion. For the vibration of the ὑπο-
are mixed up with themselves or with one another, an endless diversity arises, which must be examined by those who would put forward a probable theory concerning nature.

XXIII. Now concerning rest and motion, how they arise and under what conditions, we must come to an agreement, else many difficulties will stand in the way of our argument that is to follow. This has been already in part set forth, but we have yet to add that in uniformity no movement will ever exist. For that which is to be moved should exist without that which is to move it, or what is to move without that which is to be moved, is difficult or rather impossible; but without these there can be no motion, and for these to be uniform is not possible. So then let us always assign rest to uniformity and motion to its opposite. Now the opposite of uniformity is caused by inequality; and of inequality we have discussed the origin. But how it comes to pass that all bodies are not sorted off into their several kinds and cease from passing through one another and changing their place, this we have not explained. Let us put it again in this way. The revolution of the whole, when it had embraced the four kinds, being circular, with a natural tendency to return upon itself, compresses everything and suffers

δοχή tends to keep them all assorted and apart from each other; and this would actually be the condition of things, were it not for the πλήρους presently to be mentioned. Stallbaum supposes that the elements are κατά γένει διαχωρισθέντα: but Plato's reasoning turns precisely on the point that they are not: never completely, that is; for the bulk of each is to be found in its own home.

16. πρὸς αὐτὴν πεφυκέναι] The notion is that the whole universe globes itself about its centre with a mighty inward pressure, εἰληφαί περὶ τῶν διὰ παντὸς πεσταμένων πόλων, so that everything within it is packed as tightly as possible. The force may be compared to that exerted in winding a hank of string into a round ball. This is the second of Plato's two great dynamic powers: we shall afterwards see what varied and extensive use he makes of it.

σφίγγει πάντα] Compare Empe- dokles 185 (Karsten) Τιτᾶν ἵπτω, αἰθήρ σφιγγόν περὶ κύκλων ἀπεικονισθείς. This vast circular constriction squeezes all matter together with so overpowering force, that no vacancy is allowed to remain anywhere; but wherever there is room for a smaller particle to penetrate the interstices between the larger, it is at once forced in. So that not only are heterogeneous elements forced into combination, but the subtler and acuter figures divide the larger κατὰ τὰ τριγώνα and so change their structure: while they in turn are themselves compressed by the larger until they assume the form of the latter. Consequently we have side by side perpetually the ὒδος κάτω, fire through air to water, and the ὒδος ἄνω, water through air to fire.

2 δεύτερον...δεύτερον: δεύτερος...δεύτερος S.
14 ἀπίον: ἁπτόν Α.

3. μεγίστην κενότητα] This expression shows plainly enough that Plato was well aware of the fact which Aristotle urges as a flaw in his theory, namely that it is impossible for all his figures to fill up space with entire continuity. In the structure of air and of water there must be minute interstices of void; there must also be a certain amount of void for the reason that, the universe being a sphere, it is impossible for rectilinear figures exactly to fill it up. But, it is to be observed, Plato's theory does not demand that void shall be absolutely excluded from his system, but only that there shall be no vacant space large enough to contain the smallest existing corpuscule of matter. The larger corpuscles have larger interstices between them than the smaller. So long however as these interstices are not large enough to afford entrance to the smallest particle of any element, the effect is the same as of a solid mass without any cavities; but when once they are large enough to contain any particle, πλησίον instantly forces one into the vacancy. This is all Plato means by κενὴν χώραν οὐδεμίαν ἐξ ἱερεσθαί: he denies void as a mechanical principle, but not its existence altogether in the nature of things.

Besides the atomists, the existence of void was affirmed by the Pythagoreans; see above, 33 c, and Aristotle physique iv vi 213b 22: it was denied by the Eleatics, by Empedokles, by Anaxagoras, and by Aristotle: see physica iv vii.

5. ἡ τῆς πειλήσεως ξύνοδος] cf. Phaedo 97 η ἡ ξύνοδος τοῦ πλησίου ἀλή-

9. μεταβάλλον γὰρ τὸ μέγεθος] For example, particles of fire, by being transformed into particles of water, not only changed their magnitude, but also the region of space to which they belonged. Hence any fire in the home of fire which became water would instantly struggle to reach the home of water; and similarly with air and water; so that a perpetual flux and reflux is kept up between one region and another. In this manner the production of heterogeneity (ἀνωμαλότη-
no vacant space to be left. Therefore fire penetrates most of all through all things, and in the second degree air, since it is second in fineness, and the rest in proportion. For the substances which are formed of the largest parts have the most void left in their structure, and those made of the smallest have the least. Now the constriction of this contracting force thrusts the small particles into the interspaces between the larger: so that when small are set side by side with great, and the lesser particles divide the greater, while the greater compress the smaller, all things keep rushing backwards and forwards to their own region; since in changing its bulk each changes its proper position in space. Thus owing to these causes a perpetual disturbance of uniformity is always kept up and so preserves the perpetual motion of matter now and henceforth without cessation.

XXIV. Next we must remember that of fire there are many kinds: for instance flame and that effluence from flame, which burns not but gives light to the eyes, and that which remains in the embers when the flame is out. And so with air: the purest
tos γένεσις) is maintained, and the perpetuation of motion secured. Compare Aristotle de gen. et corr. II x 337a 7 αμα δε δηλασκ τοις των ατομοσιν, δια τι έκαστου των σωματων εις την οικελαν φερομενου χώραν εν τι άπελοφ χρόνι oι διεστάσα τά αώματα. αυτων γαρ τοιν ώστιν ώ εις άλληλα μετάβασις ει γαρ έκαστων έμενεν εν τη αυτω χώρα και μη μεταβάλλει έπο τοι τρόπων, ήδη ει διεστήσασα. μεταβάλλει μεν ουν δια την ψυραν διπλων ουσιν δια δε το μεταβάλλειν ουκ ένδεχεται μενειν οδεν αυτων εν οιδεμα χώρα τεταγμένη.

58 c—60 b, e. xxiv. Of fire there are three kinds, the flame, the light radiated from it, and the glow remaining after the flame is extinct. Of air there are many kinds, the purest being aether, the grossest mist and cloud. Water falls into two main classes, liquid and fusible: the first is ever unstable and flowing; the second is hard and compact, but can be fused and liquefied by the action of fire aided by air. Of fusible water that which is formed of the finest and most even particles is gold, an offshoot of which is adamant. A metal resembling gold, but harder owing to an admixture of earth, is bronze. And so we might describe all the rest, following our theory of probability, which serves us as a harmless and rational diversion in the intervals of more serious speculations. To proceed: when water is mingled with fire and flows freely, we call it liquid: but when fire abandons it and the surrounding air compresses and solidifies it, according to the degree of solidification we call it on the earth ice or hoar-frost, in the air hail or snow. The forms of water which circulate in the structure of plants we call in general sap: four only have peculiar names, wine, oil, honey, and verjuice.

14. το τε οπο της φλογος απου] The reading απου is unquestionably right although confirmed by only one ms. and by Galen. Plato then regards light as an effluence, issuing from the flame; the third species of fire being the red glow left in the embers when the flame has burnt down.

1. αἰθήρ καλουμένος] Hence it is
evident that Plato did not regard aether as a distinct element: cf. Phaedo ΠΠΑ, where αἰθήρ is simply the pure air of
which our atmosphere is the sediment.

ὁμίχλη καὶ σκότος] This is the ἅρ
βία ἑνστάσις of 61 C.

3. τὸ μὲν ύγρόν, τὸ δὲ χυτὸν] The
ύγρον includes all fluids which are ordi-
narily so regarded by us: that is to say,
all substances which at the normal tem-
perature are liquid and flowing: χυτὸν
comprises metals, which are normally
solid but are liquefied by the application
of strong heat. To rank metals as forms
of water seems no doubt a strange classifi-
cation: it is however adopted by Theo-
phrastos also: see de lapidibus § 1 τῶν ἐν

τῇ γῇ συνισταμένων τὰ μὲν ἐτῶν ὑδατος,
tὰ δὲ γῆς. ὕδατος μὲν τὰ μεταλλευμένα
καθάπερ ἄργυροι καὶ χρυσὸς καὶ τάλλα.

5. τῶν γενὸς τῶν ὑδατος] This
seems a very strange phrase to denote
the corpuscles which constitute water: ought
we perhaps to read τῶν μερῶν?

9. τὴν ὁμαλότητα ἀπολέσαν] Mar-
tin quite mistakes the meaning of this.
He supposes that fire has the power of
dilating the elementary triangles and so
introducing a difference of size in the
corpuscles of water. This can in no
wise be admitted by the theory. Plato’s
meaning is that the particles of fire by
interposing themselves between those of
water, to which they are of course greatly
inferior in size, destroy the homogeneous-
is that which is called by the name of aether, and the most turbid is mist and gloom; and there are other kinds which have no name, arising from the inequality of the triangles. Of water there are two primary divisions, the liquid and the fusible kind. The liquid sort owes its nature to possessing the smaller kinds of watery atoms, unequal in size; and so it can readily either move of itself or be moved by something else, owing to its lack of uniformity and the peculiar shape of its atoms. But that which consists of larger and uniform particles is more stable than the former and heavy, being stiffened by its uniformity: but when fire enters into it and breaks it up, it loses its uniformity and gains more power of motion: and as soon as it has become mobile, it is thrust by the surrounding air and spread out upon the earth: and it has received names descriptive of either process, melting of the dissolution of the mass, flowing of the extension on the ground. But when the fire goes forth from it again, seeing that it does not issue into empty space, the neighbouring air receives a thrust, and while the liquid mass is still mobile, it forces it to fill up the vacant places of the fire and unites it with itself. And being thus compressed and recovering its uniformity, seeing that fire the creator of inequality is quitting it, it settles into its normal state. And the departure of fire we call cooling; and the contraction that ensues on its withdrawal we class as solidification. Of all the substances which we have ranked as fusible kinds of water, that which is densest

ness of the whole mass. At the same time, by the interposition of the fiery particles its bulk is expanded, so that it comes into forcible collision with the surrounding air, which gives it the impulse that sheds it (κατάρελει) on the ground. It is now subject to the same conditions as υγρόν ὄξυρον, which flows owing to the inequality of its own particles. Thus the fusion and flowing of molten metal is due to two causes: (1) the intrusion of particles of fire and consequent dislocation of the particles of water, rendering the mass ἄνωμαλον and therefore εὐκτείνων—this we call melting; (2) the yielding of the now heterogeneous substance to the pressure of the air, which

we call flowing.

13. πάλιν δ' ἐκτείνοντος] Solidification is explained thus. The particles of fire, on quitting their place amid those of water, thrust against the immediately surrounding particles of air, since of course there is no vacant space to receive them. Now the metal, though the fire has left it, is still mobile and yielding, because its particles are dislocated. The air then, on the impulse of the outgoing fire, thrusts against the metal and compresses it, forcing its particles to fill up the vacancies left by the fire. Thereby the particles are restored to their old places and the metal regains its equilibrium and solidity.
comes auri, nec nisi in auro nasci videbatur. The six kinds he goes on to describe are evidently all crystals. It is clear that Plato’s χρυσός ἤδωρ was not a crystal: for the term ἄδαμας is not applied to any precious stone by writers before Theophrastos; moreover a crystal could not be a species of χυτῶν ἤδωρ, all such being forms of earth. Professor W. J. Lewis, who has been kind enough to make some inquiry into this matter on my behalf, formed the opinion, on such data as I was able to lay before him, that Plato’s ἄδαμας was probably haematite.

5. πυκνότητι δ’ ἐτι μέν] This is Baiter’s conjecture, followed by Hermann. I have adopted it as possibly accounting for the τῇ μέν of Α.

7. μεγάλα ἐν τόσο διαλείμματα] These would appear to be cavities in the substance of the metal filled with air, which cause bronze, notwithstanding its superior density, to be lighter than gold. Plato is of course mistaken in supposing that bronze is denser than gold. He attri-
and formed of the finest and most uniform particles, a unique kind, combining brightness with a yellow hue, is gold, a most precious treasure, which has filtered through rocks and there concealed: and the ‘offspring of gold’, which is extremely hard owing to its density and has turned black, is called adamant. Another has particles resembling those of gold, but more than one kind; in density it even surpasses gold and has a small admixture of fine earth, so that it is harder, but lighter, because it has large interstices within; this formation is one of the shining and solid kinds of water and is called bronze. The earth which is mingled with it, when the two through age begin to separate again, becomes visible by itself and is named rust. And it were no intricate task to explain all the other substances of this kind, following the outline of our probable account. For if we pursue this as a recreation, and while laying down the principles of eternal being find in plausible theories of becoming a pleasure that brings no remorse in its train, we may draw from it a sober and sensible amusement during our life. Now therefore setting out in this way let us go on to discuss the probabilities that lie next on the same subject.

buted the greater hardness of bronze partly to its superior density, partly to the admixture of earth: he was not aware that hardness does not depend upon density. As to the διαλεύματα, compare Theophrastos de sensu § 61, speaking of Demokritos, σκληρῶτερον μὲν εἶναι σίδηρον βαρύτερον δὲ μόλυβδον τὸν μὲν γάρ σίδηρον ἀνωμάλως συγκείσαι καὶ τὸ κενὸν ἔχειν πολλαχή καὶ κατὰ μεγάλα πεπυκνῶσαι καὶ κατὰ ἐνα * , ἀπλῶς δὲ πλέων ἔχειν κενὸν τὸν δὲ μόλυβδον ἐλάττων ἐχουστα κενὸν ὀμαλῶς συγκείσαι κατὰ πάν ὀμολος, διὸ βαρύτερον μὲν μαλακότερον δὲ τοῦ σιδῆρου. This is identical with Plato’s view, except that Demokritos held the cavities to be absolutely void.

9. ὅταν παλαιωμένω διαχωρισθοὺν] Plato considered that the rust on bronze, or verdigris, was the intermingled earth, which in course of time works its way to the surface.

12. ἢν ὅταν τις] Here we have in the plainest terms Plato’s opinion of the value of physical science. In itself it is but a harmless recreation, a pleasure leaving behind it no regrets, with which a philosopher may reasonably solace himself, when wearied with his incessant struggle after the truth. This passage should be read in connexion with 68 E διὸ ἡ χρή δ’ αἰτίας εἶδος διαρρέεσθαι κ.π.λ., where we learn that the study of ἀναγκαίων, that is to say, of the forces of material nature, is useful just so far as it bears upon the investigation of θείων, that is, of primary causes. Physical speculations then are profitable only in so far as they can be made subservient to metaphysical science; to suppose that they have any intrinsic merit is an egregious error: they can only be pursued for their own sake with a view to recreation. As regards the construction there is a slight anacolouthon; ἢν being presently superseded by τῶν γενέσεως πέρι.
μεμομεμένου ὑδρός, ὅσον λεπτὸν ὕγρόν τε διὰ τήν κίνησιν καὶ τήν ὀδόν, ἦν κυκλισμένον ἐπὶ γῆσιν ὕγρόν λέγεται, μαλακόν τε αὐτῷ τῷ τάς βάσεως ἢττου ἐδραίους οὐ̄ς ἢ τάς γῆς ὑπείκειν, τούτῳ ὅταν πυρὸς ἀποχωρισθὲν ἄρος τε μονωθῆ, γέγονε μὲν ὁμαλότερον, ἐνένεωται δὲ ὑπὸ τῶν ἔξιντων εἰς αὐτό, παγέν τε ὀνύτω τὸ μὲν ὑπέρ γῆς μάλιστα παθὸν ταῦτα χάλαζα, τὸ δ᾽ ἐπὶ γῆς κρύσταλλος, τὸ δὲ ἢττου ἠμιπαγές τε ὤν ἔτι, τὸ μὲν ὑπέρ γῆς αὐτῷ χών, τὸ δ᾽ ἐπὶ γῆς ἐμιπαγέν ἐκ δρύσου γενόμενον πάχυν λέγεται. τὰ δὲ ἰθ ἐπίστα ὑδάτων εἰδὴ μεμομεμένα ἀλλήλοις, ἐμπιπταν μὲν τὸ γένος, διὰ τῶν ἐκ γῆς φυτῶν ἠθημένα, χμοὶ λεγόμενοι διὰ δὲ τὰς μίξεις 60 Δ ἀνυφοιτήτα ἐκαστοῦ σχόντες τὰ μὲν ἄλλα πολλά ἀνώνυμα γενὴν παρέσχουσα, τέτταρα δὲ, ὡσα ἔμπυρα εἰδὴ, διαφανῆ μάλιστα γενόμενα εἰληφεὶν ὄνοματα αὐτῶν, τὸ μὲν τῆς ψυχῆς μετὰ τού σώματος ςαιραντικῆς οὖνος, τὸ δὲ λεων καὶ διακριτικῶν ὄψεως διὰ ταῦτα τε ἰδεῖν λαμπρὸν καὶ στύλῳ λιπαρὸν το ψαυταξιόμενον ἐλαιρὸν εἴδος, πίπτα καὶ κίκι καὶ ἐλαιον αὐτῷ ὅσα τ᾽ ἄλλα τῆς αὐτῆς δυνάμεως. ὅσον δὲ διαχωρικῶν μέχρι φύσεως τῶν περὶ τὸ στόμα B

2 αὐ τῷ A.
9 τῶν ante ὑδατὸν habet A.

3 τούτῳ : τούτῳ δ᾽ S.
16 κικί : τήκει Ἀ pr. m.

1. ὅσον λεπτὸν ὕγρόν τε] Although Stallbaum asserts that this sentence is 'turgi labe contaminatus', I see no necessity for alteration: his own attempts are certainly far from fortunate. The repetition of ὕγρόν, which offends him so sorely, is, I think, due to the fact that we have, as Lindau saw, an etymology implied in the words ὡσα...λέγεται 'the mode of rolling on the earth which has in fact gained it the name of ὕγρόν': as if ὕγρόν = ὑπέρ γῆς βόλον. Thus understood, the objection to the second ὕγρόν vanishes. μαλακόν τε is then coordinate with λεπτὸν ὕγρόν τε, and τῷ...ὑπείκειν with διὰ τήν κίνησιν.

4. πυρὸς ἀποχωρισθῆν] Water then in its pure and unmixed form is in a state of congelation: the liquid condition being due to the intermixture of fire which disturbs the uniformity of the whole. What we ordinarily term water then is a compound of fire and water.

ἀρος τε] It is rather hard to see what air has to do with the matter: no air entered into the composition of the ὕγρόν ὑδρός, which merely yielded to the impact of the air which pushed it from without. May not ἀρος τε be an interpolation from the hand of some copyist who thought it necessary to separate water from both the kindred elements? The copyists have an unconquerable desire to drag in all the elements, whether they are wanted or not: see note on 61 B, where there is an indisputable interpolation.

5. ὑπὸ τῶν ἔξιντων] That is to say, by the agency of the outgoing fire that thrusts the surrounding air, which in turn communicates the impulse to the water. Plato classifies the congealed forms of water according to the intensity of the compression and to the situation: when completely condensed it is on the earth ice, in the air hail; if partially condensed, it is on the earth hoar-frost, in the air snow.
Water mingled with fire, such as is rare and liquid (owing to its mobility and its way of rolling along the ground, which gets it the name of liquid), and is also soft, because its bases give way, being less stable than those of earth,—when relinquished by fire and deserted of air, becomes more uniform and is compressed by the outgoing elements; thus it is congealed, and when above the earth this process takes place in an extreme degree, the result is hail; if upon the earth, it is ice: but when the process has not gone so far but leaves it half-congealed, above the earth it is snow, and when congealed from dew upon the earth, it is called hoarfrost. Most forms of water, which are intermingled with one another, filtered through the plants of the earth, are called by the class-name of saps; but owing to their intermixture they are all of diverse natures and the great multitude of them are accordingly unnamed: four kinds however which are of a fiery nature, being more conspicuous, have obtained names: one that heats the soul and body together, namely wine; next a kind which is smooth and divides the visual current and therefore appears bright and shining to view and glistening, I mean the class of oils, resin and castor oil and olive oil itself and all others that have the same properties; thirdly that which expands the contracted

8. τὰ δὲ δὴ πλειστὰ] A complex form of water, composed of many sorts combined, are the juices of plants of which the general appellation is sap. Of these Plato distinguishes four kinds, having peculiar properties and specific names.

12. ὅσα ἔμπυρα ἑλδῆ] Plato infers the presence of fire from the brightness and transparency of these saps, not from any pungent or burning quality, which olive oil, for example, does not possess.

14. διακριτικῶν ὑφεσις] That is to say, having a bright and glistening appearance, see 68 ε, 69 λ. We must understand Plato to mean διακριτικῶν ὑφεσις μέχρι τῶν δημάτων, for what is merely διακριτικῶν ὑφεσις is white. ὑφεσ here = ὑφεσις ἰεύμα.

16. κίκα] This is castor oil, obtained from the Ricinus communis. See Herodotus Π 94, where he says that the Egyptians use this oil for anointing themselves and for illuminating purposes: it is said to be still put to the latter use in India. The word κίκα is affirmed by Herodotus to be Egyptian. Cf. Pliny nat. hist. xv 7.

17. ὅσον δὲ διαχυτικῶν μέχρι φύσεως] The construction and meaning of these words seem to have escaped all the editors. τῶν περὶ τὸ στόμα ξυνόδων depends upon διαχυτικῶν, not upon φύσεως, and the meaning is ‘that which expands the contracted pores of the mouth to their natural condition’. In 64 δ we learn that a pleasurable sensation is the perceptible transition from an abnormal to a normal state: τὸ δ’ εἰς φύσιν ἀπτιν
πάλιν ἄθροιν ἥδον: and in 66 c we find that this is just the effect produced on the tongue by a pleasant taste: τὰ δὲ παρὰ φῶς ἡνυψώτα ἢ κεχυμένα, τὰ μὲν ἦνωγγρα, τὰ δὲ χαλαῖ, καὶ πάντω ὡς οἱ μᾶλλα ἱδρύμα κατὰ φῶς. For the use of diaichës compare 45 ε., Philèbùs 46 ε.; and for ἐνυδων see 58 B, 59 A, and 61 A. Compare also Theophrastos de sensu § 84 τὰ δὲ σῶν τῇ ὑγρότητι τῇ ἐν τῇ γάλατη καὶ διαιρετικά καὶ συστατικά εἰς τὴν φύσιν γλυκέα.

3. ὅπος] This is another substance which it seems impossible precisely to identify. Martin understands opium; but this in no wise agrees with the description. It rather is some powerful vegetable acid, perhaps the juice of the silphium, as in Hippocrates de morbis acutis vol. II p. 92 Kühn. In Homer Iliad v 902 it is a liquid used for curdling milk, said to be the juice of the wild fig: see Aristotle historia animalium 111 xx 522b 2 πηγὼν. δὲ τὸ γάλα ὑπὸ τα σκυτή καὶ πινελα: cf. meteorologica IV vii 38a 20: see too Pliny natural history XVI 72, XXIII 63. The name would seem to have been applied to vegetable acids in general, not confined to the sap of one particular plant: wherefore, although I have acquiesced in the usual explanation of ἐκ πάντων ἀφορισθέν τῶν χυμῶν, it is a question to my mind whether Thomas Taylor is not more correct in rendering these words 'is secreted from all liquors'. For ὅπος is no more 'distinguished' from the other saps than are wine, oil and honey; if anything, less so. I have adopted the term 'verjuice' as the nearest rendering I could find, although this, I believe, is properly confined to the juice of the wild crab.

60 B—61 c, c. xxv. The chief forms of earth are as follows: (1) stone is formed when in a mixture of earth and water the water is resolved into air and issues forth; then the earth that remains behind is strongly compressed by the surrounding air and compacted into a rocky substance: (2) earthenware or pottery is produced in a similar way, except that the expulsion of the water is much more violent and sudden through the action of fire, and therefore the substance produced is more brittle than the former: (3) the so-called 'black stone' is formed when a certain portion of water is left
pores of the mouth to their natural condition, and by this property produces sweetness to the taste,—of this honey is the most general appellation; lastly that which corrodes the flesh by burning, a sort of frothy substance, distinct from all the other saps, which has been named verjuice.

XXV. Of the different kinds of earth, that which is strained through water becomes a stony mass in the following way. When the commingled water is broken up in the mixing, it changes into the form of air; and having become air it darts up to its own region. Now there was no void surrounding it; accordingly it gives a thrust to the neighbouring air. And the air, being weighty, when it is thrust and poured around the mass of earth, presses it hard and squeezes it into the spaces which the new-made air quitted. Thus earth, when compressed by air into a mass that will not dissolve in water, forms stone; of which the transparent sort made of equal and uniform particles is fairer, while that of the opposite kind is less fair. But that

behind, rendering the stone fusible by fire: (4) alkali and salt are composed of a mixture of earth and water, consisting of fine saline particles of earth from which a large part of the water has been expelled, but which has never been thoroughly compacted, so that the substance is soluble in water: (5) there remain compounds of earth and water which are fusible by fire, but not soluble in water. The reason why this is so is as follows: Earth in its unmodified form is dissolvable by water alone; for its interstices are large enough to give free passage to the particles of earth and fire: but the larger particles of water, forcing their way in, break up the mass. Earth highly compressed can only be dissolved by fire, for nothing else can find entrance. Water, when most compacted, can be dissolved by fire alone; when in a less degree, by fire or air. The highest condensation of air can only be dissolved by conversion into another element; the less condensed forms are affected by fire only. Now into a compound of earth and water the particles of water from without can find no entrance: but fire entering in dislocates the particles of water, and they dislocate the particles of earth, so that the whole compound is broken up and fused. Such substances are, if water predominates in the compound, glass and the like; if earth, all kinds of wax.

7. κοπη] sc. κατὰ τὰ τρέγωνα. The water, becoming air, rushes to join the surrounding air; which then thrusts the earth together, exactly as described in the solidification of metals, 59 A.

11. ἀλάτως ὅθαρ] There can be little doubt, I think, that these words are to be taken together, ‘insoluble by water’. Martin joins ὅθαρ with ἐξωφθέεινa, ‘forced into indissoluble union with water’. But Plato does not say that any of the water is left behind; and we find that when this takes place, the substance is fusible by fire, which is not here the case. Nor is it easy to see how such an inseparable conjunction could exist. The phrase seems pretty clearly contrasted with λυτω παλαν υφ’ ὅθαριν in D.

12. ἦ τῶν ὅτων] i.e. precious stones and crystals. It is clear from this that
éxarpasøn, καὶ κραυρότερον ἐκείνων ἔστιν, εἴ γενεῖ κέραμον ἐπω—νομάκαμεν, τούτο γέγονεν ἐστὶ δὲ ὅτε νοτίδος ὑπολειφθεῖσας χυτή γῆ γενομένη διὰ πυρῶς, ὅταν ψυχθῇ, γίγνεται τὸ μέλαν χρώμα ἐχων λίθος: τῷ δ' αὐτι κατὰ ταῦτα μὲν ταῦτα ἐκ ἐξμιμέξεως ὠδατος 5 ἀπομονομένων πολλοῦ, λεπτοτέρων δὲ ἐκ γῆς μερῶν ἄλμυρῳ τε ὄντε ἡμιπαγη γενομένω καὶ λυτῳ πάλιν ύφ' ὠδατος, τὸ μὲν ἔλαιον καὶ γῆς καθαρτικῶν γένους λίτρον, τῷ δ' εὔαρμόστοιν ἐν ταῖς κοι- νωνίαις ταῖς περὶ τὴν τοῦ στόματος αἰσθησιν ἀλῶν κατὰ λόγον Ἐ νόμου θεοφιλὲς σῶμα ἐγένετο. τα δὲ κοινα ἐξ ἀμφοῖν ὠδατι μὲν

δάμας cannot be the diamond or any other crystal.

1. [εξαρπασθείν] The construction with this verb seems unique, though it is of course common with ἐξαιρεθεῖν. The rapid evaporation of the water by fire and the consequent sudden violence of the compression causes the pottery to be hard and brittle. For the rather elaborate form of expression ὃ γένει...τούτο γέγονεν cf. 40 B καθάπερ ἐν τοῖς πρόσθεν ἐρήμην, κατ' ἐκείνα γέγονεν.

2. χυτή γῆ γενομένη] The reason why the continuance of moisture in the stone renders it fusible by fire is explained below at 61 B.

3. τὸ μέλαν χρώμα ἐχων λίθος] There is evidently some corruption in the text of the mss. The vulgate ἐχων cannot be construed at all: ἐχων is supported by A, but the article is not wanted with μέλαν χρώμα. Hermann restores grammar by writing ἔλθον for λίθος; yet this is not convincing. Nor yet can I acquiesce in the suggestion of the translator in the Engelmann edition, to read λίθον, supplying γένος from the previous sentence. Retaining ἐχων, we might perhaps insert ὁ before τὸ μελάν χρώμα. As to the nature of this μέλαν λίθος, it would seem to be a substance of volcanic origin, probably lava. Compare Theophrastos de lapidibus § 14 ὃ δὲ λιπαράς ἐκφοροῦται τῇ καθέσει καὶ γίνεται κοσμημαθή, ὃς ἀμα τῇ τὴν χρῆν μεταβάλλειν καὶ τὴν πυκνότητα, μέ- λαι τε γάρ καὶ λείδος ἐστὶ καὶ πυκνὸς ἀκαντός ὄν. This λιπαράτης is a volcanic stone from the Lipari islands, which Theophrastos classes among the πυρὶ τηκτὰ: on being subjected to the action of fire it leaves a residuum which is light and porous like pumice stone. The description of it while still ἀκαντότι seems to agree very well with Plato's μέλαι λίθος. Compare too Aristotle meteorologica IV vi 383b 5 τήκεται δὲ καὶ ὁ λίθος ὁ πυρὶμαχος, ὅποτε στάξει καὶ βριλτ' τὸ δὲ πυγώμενον ὅταν μην, πάλιν γίγνεται σκληρόν, καὶ αἱ μελαι τήκονται ὅποτε βριλ' τὸ δὲ βριλ' πυγώμενον τὸ μὲν χρώμα μέλαι. The ἔλθον certainly were made of lava: see Strabo vii 3, where he says of the matter ejected from the Liparean craters, ὑστερον δὲ παγηνεία καὶ γενέσαι τὸς μυλιτασ λίθος εὐκότα τὸν πάγον. It is to be observed that Theophrastos assigns the same cause as Plato for the fusibility of some stones: see de lapidibus § 10 τὸ γάρ τηκτὸν ἐμα- μον εἶναι δὲ καὶ γρήγορης ἐχεῖν πλεῖω.

4. τῷ δ' αὖτι Schneider's correction seems indispensable: I can see no reasonable way of construing the dative: and why the Engelmann translator declares the emendation to be 'zum Nach- theil des Sinnes' I cannot understand. Soda and salt are compounds of earth and water only partially compacted and consequently soluble in water; which is
which is suddenly deprived of all its moisture by the rapid action of fire and is become more brittle than the first forms the class to which we have given the name of earthenware. Again when some moisture is left behind, earth, after having been fused by fire and again cooled, becomes a certain stone of a black colour. There are also two sorts which in the same manner after the admixture are robbed of a great part of the water, being formed of the finer particles of earth with a saline taste, and becoming only half solid and soluble again by water; of these what purifies from oil and earth is alkali; while that which easily blends with all the combinations of tastes on the palate is, in the words of the ordinance, the god-beloved substance of salt. The bodies which are composed of not the case with bodies wherein the water and earth have been brought into a complete and stable union.

6. τὸ μὲν ἥλαν καὶ γῆς] I do not know that soda is specially applicable to the elimination of earth, and the words καὶ γῆς seem to me to be dubious. Lindau, imputing to Plato 'brevitatem prope similem Thucydides', somehow extracts from the words the manufacture of soap and of glass; but such more than Pythian tenebrosity of diction, I think, even Thucydidis would shrink from. By λιτρων we are to understand natron, or carbonate of soda.

7. τὸ δὲ εὐάρμοστον ἐν ταῖς κοινωνιαῖς] By this Plato means that salt is an agreeable adjunct to many flavours and combinations of flavours.

8. κατὰ λόγον νόμου] This seems plainly to indicate, which would in any case be a natural supposition, that Plato quotes the expression θεοφιλῆς σῶμα from some well-known ordinance relating to sacrificial ceremonies or from some formula used therein: but I have not been able to trace the phrase to any such origin.

9. θεοφιλῆς σῶμα] The application of the epithet θεοφιλῆς to salt is, as aforesaid, probably due to its use for sacrificial and ceremonial purposes, though this is not suggested by Plutarch in his curious little disquisition on the subject, quaest. conv. v 10. Salt was mixed with whole barley (οἰλοχίται) and sprinkled on the head of the victim. This appears to have been the only use of salt in sacrifice among the Greeks; but both in ancient and modern times it was held to be a potent preservative against witchcraft and evil spirits, and many curious customs connected with it are to be found in mediaeval folk-lore. It was likewise used in purifications—see Theokritos xxiv 94 καθαρῷ δὲ πυρῷ σατε δῶμα θεεῖρ πρῶτον, ἐπειτα δὲ ἄλεσοι μεμίγμενον, ὅσ νενόμισται, θαλλῷ ἐπιρράλειν ἐστεμένην ἀβλάβες ὑδωρ.

Homer terms it 'divine', Iliad ix 214 τὰσα δὲ ἀλὸς θέλον. According to a fable mentioned by Aristotle meteorologica ii iii 359a 27 it was a gift of Herakles to the Chaoians. In Tacitus annals xiii 57 we read that a spot where salt is found was held by the ancient Germans to be peculiarly sacred and in proximity to heaven. The passage of Athenion (apud Athenaeum xiv 79) which Stallbaum quotes as establishing the sacrificial use of salt has an opposite tendency:
3. hevi sāγκους
πῦρ μὲν ἀγρ τι τι τῆκεν, τῆς γὰρ ἑιστάσεως τῶν διακένων αὐτῆς
σμικρομερόστερα πεφυκότα, διὰ πολλῆς εὐρυχορίας ἴσωτα, οὐ βια-
ζόμενα, ἀλτον αὐτὴν ἐάσαυτα ἀτηκτον παρέσχε τὰ δὲ ὑδάτων
ἐπειδὴ μεῖξο πέφυκε μέρη, βιαον ποιούμενα τὴν διέξοδον, λύουτα
αὐτὴν τίκει. γῆν μὲν γὰρ ἄξιοστατον ὑπὸ βλας, ὑδῶς ὑδῶρ μονὸν ἄλυεν,

Originally, says the author, men both ate and sacrificed without salt; and even after they discovered that salt was good to eat, they went on sacrificing in the old way. Among some other nations, e.g. the Jews, salt was very extensively used for sacrificial purposes.

τὰ δὲ κονδὶ ἐξ ἄμφοιν] We now come to compounds of earth and water. We have indeed had already one such combination, which is λυτὸν ψῆ ὑδατος: but there the water is hardly a constituent of the solidified mass; the substance has parted with nearly all its moisture, but still remains ἡμιπαγέ. Before explaining why these compounds are dissoluble by fire alone, Plato digresses a little to explain the mode in which the several elements are dissolved. Solution and dilatation alone are treated here, not the transmutation of one element into another.

1. γῆς ὑδγον] Earth in its normal condition, ἄξιοστατον ὑπὸ βλας, is dissolved by water alone, for the interstices in its structure are so large that the minute particles of fire and air can pass in and out without obstruction and do not disturb the fabric: but those of water are too large to make their way without dislocating the particles of earth. When however earth is firmly compacted, ἐμπτηκυία, the interstices are so small that only fire can find an entrance.

8. τὴν μὲν βιαιοτάτην] Clearly metals are meant.

9. τὴν δὲ ἀσθενετέραν] Ice, snow, hail, and hoar-frost: cf. 59 E. Air dissolves these κατὰ τὰ διάκενα, i.e. by separating the particles; for ice or snow exposed to the air above a certain temperature will melt; but it still retains the form of water. Fire on the other hand, may vaporise it; which means that the corpuscles of water are dissolved and recon-
earth and water combined cannot be dissolved by water, but by fire alone for the following reason. A mass of earth is resolved neither by fire nor by air, because their atoms are smaller than the interstices in its structure, so that they have abundant room to move in and do not force their way, wherefore instead of breaking it up they leave it undissolved: but whereas the parts of water are larger, they make their passage by force and dissolve the mass by breaking it up. Earth then, when it is not forcibly solidified, is thus dissolved by water only; but when it is solidified, only by fire, for no entrance is left except to fire. And of water the most forcible congelation is melted by fire alone, but the more feeble both fire and air break up; the latter by the interstices, the former by the triangles as well. Air, when forcibly condensed, can only be resolved into the elementary triangles, and when uncondensed fire alone dissolves it. In the case of a substance formed of water and earth combined, so long as water occupies the spaces in it that are forcibly compressed, the particles of water arriving from without find no entrance but simply flow round and leave the whole

stituted as corpuscles of air: this is dissolution κατὰ τὰ τρίγωνα.

10. ἐκ δὲ αἵρα ἄσβοντα] Air in its highest condensation can only be resolved κατὰ τὰ τρίγωνα, that is by transmutation into another element. Stallbaum, not understanding this sentence, desires to corrupt it by altering πλήν to πάλων, But the text is perfectly sound and has been rightly explained by Martin. Condensed air means cloud: and cloud is ordinarily dissolved into a shower of rain; or, in the case of a thundercloud, lightning issues from it. Plato therefore, holding as he does that the cloud is a form of air, conceives it to be resolved κατὰ τὰ τρίγωνα, in the one case into water, in the other into fire. The agent which produces the metamorphosis is not specified in this instance.

11. δισεροτὸν δὲ κατατῆκει] In its normal state air is subject to the influence of fire alone, which dilates it by insinuating its own particles between those of air. Plato must have observed the fact that air expands when heated. Of course it is κατὰ τὰ διάκενα that air yields to the influence of fire alone; for it may be resolved κατὰ τὰ τρίγωνα by either fire or water, on the principles laid down in 56 E.

12. τὸ δὲ δὴ τῶν ἐμμύκτων] Now we come to the reason why substances compounded by earth and water are fused by fire alone. So long as the interspaces between the earthy particles are occupied by the particles of water belonging to the ἐστασις, the particles of water external to it, supposing the body to be plunged in water, can find no entrance; consequently they can produce no effect upon it. But the particles of fire, finding their way in, force themselves between the particles of water and disturb them: and these in their turn, being thrust against the particles of earth, dislocate the latter, and so the structure of the whole mass is broken up and fused.
πυρός εἰς τὰ τῶν ὕδατων διάκενα εἰσίοντα, ὅπερ ὕδωρ γῆν, τούτῳ ἀπεργαζόμενα, τυγχάνει τῷ κοινῷ σώματι ἰθέω μόνα αἰτία ἔμβεβηκε. τυγχάνει δὲ ταῦτα ὅντα, τὰ μὲν ἑλαττὸν ἑχοντα ὕδατος ἢ γῆς τὸ τε περὶ τὴν ὧλον γένος ἀπαν ὑπά τε λίθων χυτὰ εἰδῆ 5 καλεῖται, τὰ δὲ πλέον ὕδατος αὐ τὰν ὅσα κηροεἰδή καὶ θυματικά σώματα ἐξυμπήγισται.

XXVI. Καὶ τὰ μὲν δὴ σχῆμα σινονωνίας τε καὶ μεταλλαγάς εἰς ἄλληλα πεποικιλμένα εἰδῆ σχεδον ἐπιδέδεικται τὰ δὲ παθήματα αὐτῶν δὲ ἄς αἰτίας γέγονε περιτέλειον ἐμφανίζειν. πρώτον 10 μὲν οὖν ὑπάρχειν αἰσθησιν δεὶ τοῖς λεγομένοις ἀεὶ σαρκὸς δὲ καὶ τῶν περὶ σάρκα γένεσιν, ψυχῆς τε ὅσον θυντόν, οὕτω διεληλυ-

1 post τοῦτο δελεῖ μὴ ἄρα, quae dant codices omnes et HSZ. τοῦτο δὲ S. 7 σχῆμα: σχῆμα HSZ. 8 εἰδῆ: ἔδη Λ.

1. ὅπερ ὕδωρ γῆν, τοῦτο ἀπεργαζόμενα] The words πῦρ ἄρα, which in the mss. follow τοῦτο, I have rejected for more than one reason; the chief of which is that they are absolute nonsense. We have seen above that water acts upon earth by thrusting its particles between those of earth and forcing them asunder: likewise we have just seen that fire acts upon water by thrusting its particles between those of water and forcing them asunder. Therefore, as Plato says, fire has precisely the same action upon water that water has upon earth. But what conceivable sense is there in introducing air? Air neither is any constituent of the compound nor plays any part in its fusion: it is altogether beside the question. A minor, though still substantial, reason for rejecting the words is the grammar. If we retain πῦρ ἄρα, not only is πῦρ out of all construction, but ἀπεργαζόμενα is left forlorn of any substantive wherewith to agree. On the other hand the rejection of those two words, which I conceive to have been inserted by a copyist in an over antithetical frame of mind, restores both sense and grammar. I suspect however that Plato’s original words were τοῦτο ὕδωρ ἀπεργαζόμενα and that ὕδωρ was expelled by the two intruding elements, πῦρ ἄρα: its insertion would be a gain to the sense.

4. λίθων χυτὰ εἰδῆ] For example the μέλαν χρώμα ἑξόν λίθων mentioned above, which we saw to have an admixture of water in its composition.

61 C—64 A, c. xxvi. In order to set forth thoroughly the properties of matter, we ought to explain the nature of their action upon our bodies and the nature of the bodies that are so affected. As both these subjects cannot be dealt with at once, let us first examine the sensible qualities of things. The sensation of heat is due to the penetrating power of fire, which enters and divides the flesh: cold is a contraction of the flesh under the influence of moisture. Hardness and softness depend on the form of the constituent corpuscule, the cube being most stable and therefore most resisting. Concerning heavy and light, it is necessary to clear away some popular misconceptions. It is common to speak as if the universe were divided into two regions, upper and lower, to the latter of which all heavy bodies naturally tend. But the truth is that, the universe being a sphere, there is no such thing as an upper and a lower region in it. For if one were to travel round the universe he
bulk undissolved; but those of fire enter into the interstices of the water, and acting upon it as water does upon earth, can alone cause the combined mass to melt and become liquid. In this class those which have less water than earth are all kinds of glass and all stones that are called fusible; and those which contain more water include all formations like wax and frankincense.

XXVI. Now all the manifold forms that arise from diverse shapes and combinations and changes from one to another have been pretty fully set forth; next we must try to explain their affections and the causes that lead to them. First we must assign to all the substances we have described the property of causing sensation. But the origin of flesh and all that belongs to it and of the mortal part of soul we have not yet discussed.

would be forced to call the same point successively above and below: since it would at one time be overhead, at another beneath him. The true explanation of gravity and attraction is as follows. Owing to the vibration of the universe, every element has its proper region in space; and every portion of any element which is in an alien sphere endeavours to escape to its own sphere. For this reason, if we raise portions of earth into the region of air, they tend to make their way back to earth again, and the larger portion strives more forcibly so to return than the smaller. Hence we say that earth is 'heavy' and tends 'downward'; while fire, because it seeks to fly away from earth to its own home, we say is 'light' and tends 'upward'. But could we reach the home of fire and raise portions of it into the air, we should find this condition reversed: fire would be 'heavy' and tend 'downwards' to its own home, and earth would be 'light' and tend 'upwards' to the home of earth. And so the gravitation of all bodies depends altogether upon their position in space relatively to their proper region; and the 'weight' of any body is simply the attraction which draws it towards its own home. Such is the nature of light and heavy: roughness is due to hardness and irregularity in the

substance, smoothness to regularity and density.

7. καὶ τὰ μὲν δὴ σχῆματα] Having explained the structure of the various forms in which the four ἐτοί appear and their combinations, our next task is to set forth the causes of the sensations they produce in us. For σχῆματα the editors from Stallbaum onwards, with the exception of Martin, read σχήματα sub silentio. This reading is not mentioned by Bekker, and no ms. testimony is by any one cited for it. It is by no means an improvement; and since I can find neither its origin nor its authority I have suffered it ἐρήμων ὁφεῖν and reverted to the old reading. Ficinus translates 'eas species, quae figuris commutationibusque invicem variantur.'

8. τὰ δὲ παθήματα] The word πάθημα is here used in a rather peculiar manner. Elsewhere it denotes the impression sustained by the percipient subject from the external agent—see 64 b, c. But here πάθημα signifies a quality pertaining to the object which produces this impression on the subject. We have a similar unusual significance in ὑπαρχεῖν αἰσθητῷ below; where αἰσθητῷ denotes the property of exciting sensation.

II. ὕππηχής τε ὅσον θυγατέρων] See 69 δ, where the term is explained.
To explain the action of external objects upon the human body involves a description of the structure of the said body. But as two subjects cannot be expanded at once, we must assume (υποθέτων) one, and afterwards examine what we have assumed.

ὅσα αἰσθητά] I have taken upon me to make this correction of the ms. αἰσθητικά, which appears to me meaningless. The two subjects to be handled are (1) the structure of flesh &c, how it is capable of receiving impressions, (2) the properties of objects, how they are capable of producing impressions. But this latter is expressed by αἰσθητά, not αἰσθητικά: how can the objects in this relation be termed sentient? The corruption has arisen, I doubt not, from failure to apprehend the peculiar significance of παθήματα. A similar confusion is found in 58 D, κυνητικόν for κυνητών.

1. ὠντε ταύτα χωρίς] To explain the action of external objects upon the human body involves a description of the structure of the said body. But as two subjects cannot be expanded at once, we must assume (ὑποθέτων) one, and afterwards examine what we have assumed.

ὅσα αἰσθητά] I have taken upon me to make this correction of the ms. αἰσθητικά, which appears to me meaningless. The two subjects to be handled are (1) the structure of flesh &c, how it is capable of receiving impressions, (2) the properties of objects, how they are capable of producing impressions. But this latter is expressed by αἰσθητά, not αἰσθητικά: how can the objects in this relation be termed sentient? The corruption has arisen, I doubt not, from failure to apprehend the peculiar significance of παθήματα. A similar confusion is found in 58 D, κυνητικόν for κυνητών.

5. ἕστω πρότερα ἡμῖν] That is to say, let us first assume their nature and construction; not let us first examine them. Plato, for the sake of continuity in his exposition, takes the παθήματα first, postponing the account of σαρκός γένεσις.

6. ἧ πῦρ θερμῶν] So then θερμῶν is the πάθημα of πῦρ: we have to inquire how fire acts, so as to possess this πάθημα.

τὴν διάκρισιν] Aristotle demurs to this explanation: see de gen. et corr. II ii 321b 26 θερμῶν γὰρ ἐστὶ τὸ συγκρόνον τὰ ὁμογενή (τὸ γὰρ διακρινέτω, ἀπὸ περὶ φασίν ποιεῖν τὸ πῦρ, συγκρένειν ἐστὶ τὰ ὁμόφυλα: συμβαίνει γὰρ ἐξαιρέω τὰ ἀλλότρια), ψυχῶν δὲ τὸ συνάγων καὶ συγκρόνον ὀρόσώς τὰ τε συγγενῆ καὶ τὰ μῆ σομαίντρα. Theophrastos also complains that Plato does not explain heat and cold on the same principle: de sensi § 87 ἄστοιν δὲ καὶ τούτου πρῶτον μὲν τὸ μῆ πάντα ὀρόσώς
Now this cannot be adequately dealt with apart from the affections of sense, nor yet can the latter without the former; yet to treat them both at once is hardly possible. We must assume one side then, and afterwards we will return to examine what we assumed. In order then that the properties of the several elements may be discussed in due order, let us first assume the nature of body and soul. First then let us see what we mean by calling fire hot; which we must consider in the following way, remembering the power of dividing and cutting which fire exercises upon our body. That the sensation is a sharp one we are all well enough aware: and the fineness of the edges and sharpness of the angles, besides the smallness of its particles and the swiftness of its motion, all of which qualities combine to render it so vehement and piercing as keenly to cut whatever meets it—all this we must take into account, remembering the nature of its figure, that this more than any other kind penetrates our body and minutely divides it, whence the sensation that we now call heat justly derives its quality and its name. The opposite condition, though obvious enough, still must not lack an explanation. When the larger particles of moisture which surround the body enter into it, they displace the smaller, and because they are not able to pass into their places, they compress the moisture within

\[\text{αποδούναι, μηδὲ ὅσα τῷ αὐτῷ γένους· ὀρίσας γὰρ τὸ \textit{khero}ν \sigmaχίματι τὸ \psiχρὸν \οὐχ ὑσαῖτως \απέδωκεν.} \]

But it seems to me that the action of moisture in producing cold does, in Plato's account, depend on the form of the particles. It must at any rate be allowed that Plato's explanation has over Aristotle's, as pronounced in the passage above cited, the advantage of clearness and simplicity.

11. \textit{λογιστεῖν \ ἀναμμηησκομένοις} i.e. if we call to mind the form of its constituent particles, we cannot fail to see that fire must necessarily have a highly penetrating power.

14. \textit{ὅ \νυν \θερμὸν \ λέγομεν} As is clearly indicated by \textit{νυν}, an etymology is intended; and the only possible reference is to \textit{kermatizo}a. Plato would say that the word was originally \textit{kermo}ν, 'cutting'.

The text ends with a note relating to the term \textit{tōn περὶ τὸ σώμα υψρῷν}. Water then is for Plato the preeminently cold element; this view was shared by Aristotle; see meteorologica \textit{iv} \textit{xi} 389b 15.

Chrysippus said air: Plutarch in his treatise \textit{de primo frigido} argues fantastically in favour of earth. Plato's theory of cold is this. The larger particles of moisture surrounding the body displace the smaller moist particles in the body, but owing to their size cannot occupy the place of the latter. Hence by the \textit{πελώσis} the substance of the body is compressed to fill up the vacant spaces. This, in its extremest form, is freezing; and the mutual repulsion of the corporeal particles thus forced into unnatural con-
tigunity is trembling and shivering. Cf. Philebus 32a.

2. μάχεται κατά φύσιν] Plutarch gives a somewhat different account of shivering: de primo frigido ví ύφ' ὁν ὄν τε θεί ἄνα τε θεί παρέλημπται καὶ μάχεται, τῇ μάχῃ ὁ' αὐτῶν ὄνομα φρίκη καὶ τρόμος.

4. τὸ πάθος...καὶ τὸ δρόμον] i.e. we apply the term cold both to ice and to the sensation it produces in us.

6. πρὸς ἀλλήλα τε οὖτως] i.e. the terms hard and soft are applied to them in relation to each other, as well as in relation to our flesh: thus lead, which yields to iron, is soft in relation to iron, though hard in relation to our flesh. Theophrastos takes exception to this definition also: de sensis § 87 ἐκεῖ δὲ μαλακῶν τὸ ὑπείκον, φανερῶν ὅτι τὸ ύδωρ καὶ ὁ ἄγρ καὶ τὸ πῦρ μαλακά φησι γὰρ ὑπείκειν τὸ μικρὰ ἔχων βάσαν, ὡστε τὸ πῦρ ἀν ἐκ μαλακότατον. διὸ μὲ τὸν τοῦτον ὄνθεν ὡδ' ὄλως τὸ μῆ μένον ἀλλὰ μειυστάμενον ἐὼν μαλακῶν, ἀλλὰ τὸ εἰς τὸ βάθος ὑπείκον οὖν μὴ ἀντιπεριστασθαι τὸ γὰρ ύδωρ οὐ μαλακῶν οὐ γὰρ ὑπείκει τῇ θλίψει τὸ ἐπίπεδον εἰς βάθος ἀλλ' ἀντιπεριστασθαι. This is of course merely a question of names.

9. βαρύ δὲ καὶ κούφον] Here we have Plato's theory of attraction and gravitation, which is unquestionably by far the most lucid and scientific that has been propounded by any ancient authority. The popular notion was that the portion of the universe which we occupy is κάτω, and that above our heads ἀνω: βαρύ is that which has a tendency to move κάτω, κούφον that which has a tendency to move ἀνω, or at least a slighter tendency κάτω. Plato clearly saw the unscientific nature of this conception. The explanation he offered in its place was this. We have seen that the vibration of the ὑποδοχή tends to sift the four elements into separate regions in space; but owing to the πτώσεις portions of them are found scattered all over the universe. A mass of any element that finds itself in an alien sphere endeavours with all its might to escape to its proper region: and it is just this endeavour which constitutes its gravity: attraction is the effort of all matter to obey the sifting
us; and whereas it was irregular and mobile, they render it immovable owing to uniformity and contraction, and so it becomes rigid. And what is against nature contracted in obedience to nature struggles and thrusts itself apart; and to this struggling and quaking has been given the name of trembling and shivering: and both the effect and the cause of it are in all cases termed 'cold'.

'Hard' is the name given to all things to which our flesh yields; and 'soft' to those which yield to the flesh; and so also they are termed in their relation to each other. Those which yield are such as have a small base of support; and the figure with square surfaces, as it is most firmly based, is the most stubborn form; so too is whatever from the intensity of its compression offers the strongest resistance.

Of 'heavy' and 'light' we shall find the clearest explanation if we examine them together with the so-called 'below' and 'above'. That there are naturally two opposite regions, dividing the universe between them, one the lower, to which sink all things that have material bulk, the other upper, to which everything rises against its will, is altogether a false opinion. For

force which is in nature. So when we raise any substance of an earthy nature, the earthward impulse which we observe in it is not due to the fact that the earth is the downward region whither all heavy bodies tend to fall, but to this sifting force which causes the mass of earth to strive towards its own sphere.

Aristotle in his criticism of Plato's theory (de caelo IV ii 308a 34 foll.) simply ignores the whole point of it from beginning to end. The extent to which he has done so may be gathered from the following citation: Óστε οὐ δὲ ἐλεγόητα τῶν τριγώνων ἐξ ὧν συνεστάναι φαίνεται ἐκαστὸν αὐτῶν, τὸ πῦρ ἀνω φέρεσθαι πέρικεν, τὸ τε γὰρ πλεῖον ἤπτον ἄν εὑρέτεο καὶ βαρίτερον ἄν ἦν ἐκ πλεύσων ὑπὸ τριγώνων, νῦν δὲ φαίνεται τοιναντιόν ἀεὶ γὰρ ἄν ἦν πλεῖον, κοινοφόρον ἐστὶ καὶ ἄνω φέρεται δύντων. That is to say, Aristotle actually urges the fact that a larger body of flame has a stronger upward tendency than a smaller as an objection to Plato's theory; whereas it is precisely what Plato affirms must on his principles inevitably be the case. Aristotle's own doctrine differed but little from the vulgar notion on the subject: see physica IV v 212a 24 ὅστ' ἐπεὶ τὸ μὲν κοῦφον τὸ ἄνω φερόμενον ἐστὶ φύσει, τὸ δὲ βαρό τὸ κάτω, τὸ μὲν πρὸς τὸ μέσον περίεχον πέρας κάτω ἐστι, καὶ αὐτὸ τὸ μέσον, τὸ δὲ πρὸς τὸ ἐσχατὸν ἄνω, καὶ αὐτὸ τὸ ἐσχατον. Theophrastos in his statement of the Platonic theory (de sensu § 88) shows a clearer comprehension of it, though marred by a hankering after a ἀπλῶς βαρὺ καὶ κοῦφον. Anaxagoras divided space into ἄνω καὶ κάτω: see Diogenes Laertius II § 8: but Aristotle says neither he nor Empedokles gave any definition of βαρὺ and κοῦφον: de caelo IV ii 309a 20.
3. ἐν τῷ καταντικρῷ] The universe being a sphere, every point on the circumference (ἔσχατα) has precisely the same relation as every other to the centre, which is right opposite to each. There is therefore nothing whereby one portion of the circumference can be differentiated from another so as to justify us in terming one ὄνω and the other κάτω. Nor yet will Plato allow the correctness of terming the centre κάτω, as Aristotle subsequently did, nor ἄνω either: it is just 'the centre'—αὐτὸ ἐν μέσῳ. However in Phaedo 112E the centre of the earth is regarded as the lowest point: but in that passage physics are largely tempered with mythology.

8. μᾶλλον πρὸς τὸ μέσον] That is, no part of the circumference has any difference in its relations towards the centre, as compared with any part on the opposite side.

10. ἐν οὖν ὄψιν οὐκ ἐν οἷς ἦν ὅτι ἐν τῷ μέσῳ τῷ καταντεικρῷ νομίζειν, τὸ δὲ μέσον τὰ αὐτὰ μέτρα τῶν ἐσχάτων ἀφεστικῆς ἐν τῷ καταντεικρῷ νομίζειν δει πάντων ἐναι. τοῦ δὲ κόσμου ταύτη τε φευκότος τί τῶν εἰρημένων ἄνω τις ἢ κάτω τιθέμενος οὐκ ἐν δίκη δόξει τὸ μηδὲν προσήκον ὄνομα λέγειν; ο μὲν γὰρ μέσος ἐν αὐτὸ τόπος οὔτε κάτω πεφυκώς οὔτε ἄνω λέγεσθαι δίκαιος, ἀλλ' αὐτὸ ἐν μέσῳ ὁ δὲ πέριξ οὔτε δὴ μέσος οὔτ' ἔχων διάφορον αὐτοῦ μέρος έτερον βαθέρον μάλλον πρὸς τὸ μέσον ἢ τί τῶν καταντεικρῶν. τοῦ δὲ ὀμοίως πάντη πεφυκότος ποτά τις εἰρημέρειν ὄνοματα αὐτῷ ἑαυτία καὶ πη' καλῶς ἢ ἤγοιτο λέγειν; εἰ γὰρ τι καὶ στερεὸν εἶ ἐκατα μέσον τοῦ παντὸς ίσοπαλέσε, εἰς οὖν ἄν ποτε τῶν ἐσχάτων ἐνεχθεὶ διὰ τὴν πάντη ὀμοιότητα 63 Α αὐτῶν· ἀλλ' εἰ καὶ περὶ αὐτὸ πορεύοιτο τίς ἐν κύκλῳ, πολλάκις ἀν στάσιν τοῦτον αὐτοῦ κάτω καὶ ἄνω προσείτοι. τὸ μὲν γὰρ ὅλον, καθάπερ εἰρητά στὸν δὴ, σφαιρειδεῖς δὲν, τόποι τινὰ κάτω, τὸν δὲ ἄνω λέγειν ἔχειν οὐκ ἐμφρονος· ὅθεν δὲ ὅνομάσθη ταῦτα καὶ ἐν οἷς ὄντα εἰδίσμεθα δὲ ἐκεῖνα καὶ τὸν ὀμοίων ὅλον οὗτο διαφορ' μενοι λέγειν, ταῦτα διομολογητέον ὑποθέμενοι τάδε ἢμιν. Β εἰ τις ἐν τῷ τοῦ παντὸς τόπῳ, καθ' οὖν ἢ τῷ πυρὸς ἐξίληξε μάλιστα 20 φύσις, οὐ καὶ πλείστου ἂν ἥθροισμένον εἰή πρὸς ὁ δὲ φέρεται, ἐπεμβάς

3. ἐν τῷ καταντεικρῷ] The universe being a sphere, every point on the circumference (ἔσχατα) has precisely the same relation as every other to the centre, which is right opposite to each. There is therefore nothing whereby one portion of the circumference can be differentiated from another so as to justify us in terming one ὄνω and the other κάτω. Nor yet will Plato allow the correctness of terming the centre κάτω, as Aristotle subsequently did, nor ἄνω either: it is just 'the centre'—αὐτὸ ἐν μέσῳ. However in Phaedo 112E the centre of the earth is regarded as the lowest point: but in that passage physics are largely tempered with mythology.

8. μᾶλλον πρὸς τὸ μέσον] That is, no part of the circumference has any difference in its relations towards the centre, as compared with any part on the opposite side.

11. εἰ γὰρ τι καὶ στερεὸν εἶ] If there were a solid body at the centre of the universe (such as the earth in the Platonic cosmology actually was), such is the uniformity of the sphere in which it is, that it would have no tendency towards any one point in the circumference rather than any other: therefore for it there would be no ὄνω nor κάτω in any direction. Compare Phaedo 109A ἰδώροστον γὰρ πράγμα ὁμολογεῖν ἐν μέσῳ τεθέν οὐχ ἔξει μάλλον οὖθ' ἄλλων ὤδαμοι ὁμολογεῖν ἵππος κληθήσα, ὁμολογεῖ δ' ἔχον ἄλλων μένει.

13. εἰ καὶ περὶ αὐτὸ πορεύοιτο τίς] A second illustration of the want of significance in the terms ὄνω and κάτω is this. If one were to travel round the circumference, he would be forced, if he used the words in the popular way, to call
since the form of the universe is spherical, all the extreme points, being equally distant from the centre, are by their very nature equally extreme; and the centre, being equally distant from all the extremities, ought to be regarded as opposite to all such points. This being the nature of the universe, how can one describe any of the said points as upper or lower, without justly being censured for using irrelevant terms? For the centre cannot properly be described as being above or below, but simply at the centre; while the circumference is neither itself central nor has any difference between the points on its surface, so that one has a different relation to the centre from an opposite point. Since then it is everywhere uniform, how and in what sense can we suppose we are speaking correctly if we use terms which imply opposition? For suppose in the midst of the universe there were a solid body in equilibrium, it would have no tendency towards any point in the circumference, owing to the absolute uniformity of the whole: indeed if we were to walk round the sphere, frequently, as we stood at the antipodes of our former position, we should call the same point on its surface successively ‘above’ and ‘below’. For this universe being spherical, as we just now said, no rational man can speak of one region as upper, of another as lower: however whence these names were derived and under what conditions we use them to express this division of the entire universe, we may explain on the following hypothesis. In that region of the universe which is specially allotted to the element of fire, where indeed the greatest mass would be collected of that to which it is attracted, if one should attain to this place, and,

the same point both ἀνω and κάτω: for the point that now is κάτω will be ἀνω when he reaches the antipodes thereof. I think we must conceive the traveller to be moving round the inside of the circumference of the universe; not, as Stallbaum supposes, round the στερεόν. For were he walking round the latter, every point in it would always be κάτω in the vulgar sense.

19. καθ’ ὑ] Stallbaum would expunge καθ’. But I think we may readily supply an object with ἐξηχε, ‘in which fire has its allotted place.’ Compare Aeschylus Seven against Thebes 423 Κα-πανίδος ὅ ἐν’ Ἡλέκτραιοι ἐληχευ̣ν πῦλαις. See too 41 c above.

20. πλείστον ἀν ηθροίσμενον ἑ] Although detached portions of fire are to be found in all parts of the universe, yet, since all fire is perpetually struggling to reach its proper home, naturally the great bulk of the element will be accumulated in that region.
1. **πυρός ἄφαιρών ἱσταίῃ**] Our misconception about the nature of light and heavy is due to this cause. We are confined to this region of earth and water; and when we weigh masses of earth or water, we find that they always have a tendency in one direction. This tendency we call weight, and the direction in which they tend we call downward; and because earth and water resist our efforts to remove them from their own region, we conceive of them as absolutely heavy. Fire, on the other hand, so far from resisting any effort to lift it from the region which earth and water seek, has a natural impulse to fly from it; whence we conceive of fire as absolutely light. But this opinion is due to the limitation of our experience to one sphere. Could we reach the home of fire and endeavour to raise portions of it into the region of air, as we now do with earth and water, we should then find that fire resisted our efforts precisely as earth and water do now: it would have a similar tendency to revert to its proper region, and would be ‘heavy’; while earth or water, so far from resisting the effort to remove it from the region of fire, would have a natural impulse to fly off in the direction of earth, and would be ‘light’. Accordingly, whereas now we call the region of earth ‘down’, and things that tend towards it ‘heavy’, we should, in the supposed case, call the region of fire ‘down’ and things that tend towards fire ‘heavy’. There is therefore no such thing as absolute lightness and heaviness; all things are light or heavy only relatively to the region in which they are situate.

2. **βαταί** is middle, as in Aeschylus Agamemnon 385 βαταί δ’ ἀ τάλαινα πειθῶ.

3. **ἕτον** is of course to be joined with ἵνα ἐπετεθήκαν.

4. **ταῦτον δὲ τούτο δεὶ φωράσαι.**
acquiring the needful power, should separate portions of fire and weigh them in scales, when he raises the balance and forcibly drags the fire into the alien air, evidently he overpowers the smaller portion more easily than the larger: for when two masses are raised at once by the same force, necessarily the smaller yields more readily to the force, the larger, owing to its resistance, less readily: hence the larger mass is said to be heavy and to tend downwards, the smaller to be light and to tend upwards. This is exactly what we ought to detect ourselves doing in our own region. Moving as we do on the earth, we separate portions of earthy substances or sometimes earth itself, and drag them into the alien air with unnatural force, for each portion clings to its own kind. Now the smaller mass yields more readily to our force than the larger and follows quicker into the alien element; therefore we call it ‘light’, and the place into which we force it ‘above’; while to the opposite conditions we apply the terms ‘heavy’ and ‘below’. Now that these mutual relations should vary is inevitable, because the bulk of the several elements occupy contrary positions in space. For as between a body that is light in one region and a body that is light in the opposite region, or as between two that are heavy, as well as upper and lower, all the lines of attraction will be found to become and remain relatively contrary and transverse and different in every possible way. But with all of them this one principle is to be borne in mind, that in every case it is the tendency towards the kindred element a variety of ways.

18. ἑναντία καὶ πλάγια] Different substances which are imprisoned in an alien region will have the lines of their attraction in some instances opposite, as in the case of masses of fire and of earth in the region of air, in others the lines may be inclined at any angle (πλάγια) one to another, according to the position occupied by the two bodies in relation to their proper regions. Plato is insisting that the lines of gravitation are not parallel.

20. ἦ μὲν πρὸς τῷ ἐγγενὲς ὁδὸν] Here we have the definite statement in so many words that gravity is just the attraction
of a body towards its proper sphere; and for every substance the direction of its proper sphere, wherever that may be, is κάτω, and the opposite ἀνω. By τὰ δὲ τῶν κατόπτων κ.τ.λ. Plato means that while in a given region we apply the term βαρύ to a substance whose ὀδὸς πρὸς τὸ ξύγγενες is towards that region, we apply the term κοίφον to a substance whose ὀδὸς πρὸς τὸ ξύγγενες is towards another. To adopt Martin's example, in the region of earth stones are heavy and vapour light; but in the region of air vapour is heavy and stones light.

5. σκληρότης γάρ] With this clause τὸ μὲν has of course to be supplied.

64 A—65 B, c. xxvii. We have now to explain the nature and cause of pleasure and pain. Sensation is produced in the following way. If an impression from without lights upon a part of the body of which the particles are readily stirred, those particles which first received the impact transmit the motion to their neighbours; and so it is handed on until it reaches the seat of consciousness; at which point sensation is effected. If on the contrary the impression is received by a part of the body which is hard to stir, the motion is not transmitted, and no sensation ensues. This being so, the explanation of pleasure and pain is as follows. When any of the particles that constitute our body are suddenly and in considerable numbers forced out of their normal position, the result is pain; and when they in like manner return to their normal position, the result is pleasure. If however either process takes place on a very small scale or very gradually, it is imperceptible. When the corporeal particles yield to the external impact with extreme readiness, the process is accompanied by vivid perception, but neither by pleasure nor by pain. If the disturbance has been slow and gradual, and the restoration rapid and sudden, we experience pleasure without antecedent pain; but if these conditions are reversed, we feel pain in the disturbance, but the restoration affords no pleasure.

7. τῶν κοινῶν περὶ ὅλον τὸ σῶμα.] An explanation of pleasure and pain will complete our account of the sensations.
that makes us call the falling body heavy, and the place to which it falls, below; while to the reverse relations we apply the opposite names. So much then for the causes of these conditions. Of the qualities of smooth and rough any one could perceive the cause and explain it to another: the latter is produced by a combination of hardness and irregularity, the former by a combination of uniformity and density.

XXVII. We have yet to consider the most important point relating to the affections which concern the whole body in common; that is, the cause of pleasure and pain accompanying the sensations we have discussed: and also the affections which produce sensation by means of the separate bodily organs and which involve attendant pains and pleasures. This then is how we must conceive the causes in the case of every affection, sensible or insensible, recollecting how we defined above the source of mobility and immobility: for this is the way we must seek the explanation we hope to find. When that which is naturally mobile is impressed by even a slight affection, it spreads abroad the motion, the particles one upon another producing the same effect, until coming to the sentient part it announces

which are not confined to any special organs, but affect the body as a whole: next we shall proceed to discuss the separate senses.

8. ἐν οἷς διεληλύθαμεν] i.e. in the perceptions treated in the preceding chapter.

11. ἀναισθήτου παθήματος] A πάθημα then, we see, is not always accompanied by αἰσθησίς. The distinction is this. Evcry external influence affecting the body is a πάθημα, but, unless it is transmitted to the seat of consciousness, it does not produce αἰσθησίς. Thus cutting the hair is a πάθημα, but not an αἰσθησίς: or, to take another example, a deaf man has the πάθημα but not the αἰσθησίς of sound; the air-vibrations are conveyed to his ear, but stop short there without being announced to the brain. The word πάθημα, it will be observed, being now applied to the subject, has a different significance from that in which we saw it used in the preceding chapter.

16. μόρια ἐτερα ἐτέρους] The word μόρια is usually considered as the object of διαδίδωσιν. But this seems to me strained; since what the εὐκίνητον transmits is the πάθος, not its own particles. I should prefer to regard μόρια as placed in a kind of apposition, the construction being somewhat similar to that in Sophokles Antigone 259 λόγοι 8' εν ἄλλη- λωσιν ἐρρόθων κακοὶ, φύλαξ ἐλεγχων φύ- λακα: cf. Herodotus xi cxviii (quoted by Prof. Campbell) ὥστε διόντα θετε ἀντὶ ἐξ ἐτέρων γίνεται, αἱ νύκτες ἡμέρας ποιεί- μεναι. Just below the μόρια are spoken of as transmitting the πάθος, διαδίδιντων μορίων μορίοις ἀλλων ἄλλως.

ταύτων ἀπεργαζόμενα] i.e. affecting them with the same πάθος. The theory of sensation here enunciated is also set forth in Philebus 33 D: see too Republic 584 C αὐ γέ διὰ τοῦ σώματος ἐπὶ τὴν
The page contains a translation of a section from Plato's work. The text discusses the distinction between physical and subjective perceptions. It mentions the importance of distinguishing between the body and the soul, and how the soul perceives pleasure differently than the body. Aristotle's objections to this distinction are also highlighted. The text compares Plato's theory of the soul with Aristotle's, suggesting that while Plato focuses on the physical body, Aristotle considers both the subjective and objective aspects of pleasure.
the property of the agent: but a substance that is immobile is too stable to spread the motion round about, and thus merely receives the affection but does not stir any neighbouring part; so that as the particles do not pass on one to another the original impulse which affected them, they keep it untransmitted to the entire creature and thus leave the recipient of the affection without sensation. This takes place with our bones and hair and all the parts we have which are formed mostly of earth: while the former conditions apply in the highest degree to sight and hearing, because they contain the greatest proportion of fire and air. The nature of pleasure and pain must be conceived thus: an affection contrary to nature, when it takes place forcibly and suddenly within us, is painful; a sudden return to the natural state is pleasant; a gentle and gradual process is imperceptible; and one of an opposite character is perceptible. Now a process which takes place with perfect facility is perceptible in a high degree, but is accompanied neither by pleasure nor by pain. An example will be found in the affections of the visual current, which we said above was in the daytime a material body cognate with ourselves. In this cutting and burning and any other affection cause no pain; nor does pleasure ensue when it returns to its normal state: but its perceptions are most vivid and accurate of whatsoever impresses it or whatsoever itself meets and touches. For its dilation and contraction

The θυεως ῥεῖμα (which we must remember to be actually part of ourselves) is composed of extremely subtle and mobile particles, which yield without resistance to any external impulse. This may come in contact with fire or be divided by a sharp instrument, and yet, while the καθεσι and the τομή are clearly perceived, no pain is felt, notwithstanding that in either case the particles are very much dislocated. Plato is of course speaking merely of bodily pain and pleasure, not of the mental pleasure awakened by the sight of a beautiful object or of the disgust excited by a spectacle of contrary nature. The process of seeing, as such, is normally unattended by physical pain or pleasure.

14. ἐν τοῖς πρόσθεν] 45 B. By τὴν δύναμιν we are as before to understand the θυεως ῥεῖμα.
15. ξυμφέως ἡμῶν] Stallbaum is perhaps right in reading ἠμῶν. But as ξυγγενής is several times followed by the genitive (see 30 D) it seems possible that ξυμφέων might have the same construction. ξυμφετως seems to have the same government in Philebus 51 D καὶ τούτων ξυμφέτων ἡδονᾶς ἐπομένας.
18. καὶ δοσων ἄν] A similar fulness of detail is in 45 C δοσων τ' ἄν αὐτό ποτε ἐφάπτεται καὶ ὅ ἀν ἄλλο ἔκεινον.
19. Διακρίει τα αὐτής καὶ συγκρίει[ These terms are explained when Plato comes to treat of colours, 67 C foll.
κρίσει τε αὐτῆς καὶ συγκρίσει. τα δ' ἐκ μεξίων μερῶν σώματα μόνες εἰκόνα τῷ δρόμῳ, διαδιδόντα δὲ εἰς ὅλον τὰς κατάσχεις, ἤδονας ἵσχει καὶ λύτας, ἀλληλούμενα μὲν λύτας, καθίσταμεν δὲ εἰς 65 τὸ αὐτὸ πάλιν ἤδονας. ο洗手 δὲ κατὰ σμικρὰν τὰς ἀποψήφησις 5 ἐαντῶν καὶ κενώσεις εἰληφε, τὰς δὲ πληρώσεις ἀδρόας καὶ κατὰ μεγάλα, κενώσεως μὲν ἁναίσθητα, πληρώσεως δὲ αἰσθητικά γνή

νόμενα, λύτας μὲν οὐ παρέχει τῷ θυτῷ τῆς ψυχῆς, μεγίστας δὲ ἤδονας· ἔστι δὲ ἐκδηλα περὶ τὰς εὐδοκίας. ὥσα δὲ ἀπαλλοτριοῦται μὲν ἀδρόα, κατὰ σμικρὰ δὲ μόνες τε εἰς ταῦτα πάλιν ἐαντοῖς καθι

10 στατα, τοῦναντίον τοῖς ἐμπροσθεν πάντα ἀποδίδουσιν ταῦτα δ' αὐτῷ περὶ τὰς κατάσχεις καὶ τομὰς τοῦ σώματος γνήνομένα ἔστι κατάδηλα.

XXVIII. Καὶ τὰ μὲν δὴ κοινὰ τοῦ σώματος παντὸς παθήματα, τῶν τ' ἐπανωμιὼν ὁσα τοῖς δρόσοις αὐτὰ γεγόνασι, σχεδὸν εἰρήταν· τὰ δ' ἐν ὑδίοις μέρεσιν ἡμῶν γνήνομεν, τα τε πάθρ καὶ 15 τὰς αἰτίας αὐ τῶν δρόσων, πειρατέον εἰπεῖν, ἃν θ' ὑμώμεθα. α. πρῶτον οὖν ὅσα τῶν χυμῶν πέρι λέγοντες ἐν τοῖς πρόσθεν ἀπελεπιμενε, ἵδια ὅντα παθήματα περὶ τὴν γλώτταν, ἐμφανιστέον ἣν δυνατόν. φανεῖται δὲ καὶ ταῦτα, ὡςπερ οὖν καὶ τὰ πολλά, διά

1. ἐκ μεξίων μερῶν] It will be re-

membered that the visual stream consist-
ed of very fine particles of fire; not the
very finest, since the rays from some
objects penetrate and divide the visual
current: see 67 E.

7. λύτας μὲν οὐ παρέχει] When
the dislocation has been very gradual
and the restoration rapid, we have acute
pleasure without any antecedent pain.
Such pleasures are called in the Republic
and Philebus καθαραί ἤδουα, as distin-
guished from μυκαί: see Republic 584 c
and Philebus 51 b, where the example of
sweet smells is given, as well as beautiful
colours, shapes and sounds. In our pre-
sent passage Plato adds a little to the
explicitness of his statement: he shows
that ὡμαί are just as much καταστάσεις
as the μυκαί, only the κενώσεις being in-
sensible, we felt no preliminary pain.
He seems to regard sweet odours as the
natural nutriment of the nostrils, which
suffer waste when those are absent: but
the depletion is so imperceptible that it
is only by sudden restoration of the na-
tural state that we become conscious
that there has been any lack. The state-
ment in the Philebus, i. i., though briefer,
amounts to the same: ὥσα τὰς ἐνδείας
ἀναισθήτους ἑξορτά καὶ ἀλόποτα τὰς πλη-
rώσεις αἰσθήται καὶ ἠδονίς καθαράς λυτῶν
παραδώσων. Aristotle tells us (de sensu
v 445 a 16) that certain Pythagoreans be-
lieved that some animals were nourished
by smell.

8. ἀπαλλοτριοῦται μὲν ἀδρόα] On
the other hand there are cases where the
disturbance is violent and causes severe
pain, but the restoration is too gradual
to afford any pleasure. This is to be
seen in wounds and burns and such like;
the process of healing causes no pleasure.
65 E—66 c, c. xxviii. So much for the
are entirely free from violence. On the other hand bodies formed of larger particles, reluctantly yielding to the agent, and spreading the motions through the whole frame, cause pleasure and pain; when they are disturbed giving pain, and pleasure in being restored to their proper state. Those things which suffer a gradual withdrawing and emptying, but have their replenishment sudden and on a large scale, are insensible to the emptying but sensible of the replenishment; so that while they cause no pain to the mortal part of the soul, they produce very intense pleasure. This is to be observed in the case of sweet smells. But when the parts are disturbed suddenly, but gradually and laboriously restored to their former condition, they afford exactly the opposite result to the former: this may be seen in the case of burns and cuts on the body.

XXVIII. Now the affections common to the body as a whole and the names that have been given to the agents which produce them have been well-nigh expounded: next we must try to explain, if we can, what takes place in the separate parts of us, both as to the affections of them and the causes on the part of the agents. First then we must set forth to the best of our power all that we left unsaid concerning tastes, which are affections peculiar to the tongue. It appears that these,

sensations affecting the whole body and their causes; we have now to inquire into the separate sensory faculties. We will first take taste. This depends upon the contraction or dilatation of the pores of the tongue by substances that are dissolved in the mouth. Whatever powerfully contracts the small vessels of the tongue is harsh and astringent; that which has a detergent effect we call alkaline, or if its action is milder, saline. A substance which is volatile and inflames the vessels is called pungent; and one that produces a kind of fermentation or effervescence is acid. All the foregoing exercise a disturbing influence upon the substance of the tongue: that which mollifies it and restores the disturbed particles to their natural state, producing a pleasurable sensation, is named sweet.

13. τοῖς δρῶσιν αὐτά] i.e. the agents or forces which produce the παθήματα.
16. ἐν τοῖς πρόσθεν ἀπελπισμοῖς] The reference would seem to be to the enumeration of χυμὸν in 60 A. Plato's statement is quoted by Theophrastos de causis plantarum vi i: to the list of χυμὸν given by Plato in the present passage he adds λιπαρός. Farther on he gives the views of Demokritos, who referred differences of taste to differences in the shape of the atoms: cf. de sensu §§ 65—69. Opinions not dissimilar to Plato's are ascribed to Alkmaion and to Diogenes of Apollonia by pseudo-Plutarch de placitis philosophorum iv 18.
17. περι τὴν γλαύταν] The under surface of the soft palate is said by anatomists to share this function with the tongue.

3 dokimia: dokîma HSZ. 14 leaivômena: leaiwvômena ASZ.

1. diâ sugkrísewv] Nearly all sense-

perception is reduced by Plato to con-

traction and expansion, which however

in different organs produce different

classes of sensation. This is the agency

by which taste is brought about, though

the tongue is in a peculiar degree affected

by the roughness or smoothness of the

entering particles.

prós de autais] sc. tais sugkríseis

kai diakríseis.

3. olîntper dokimia] The word dokî-

meîn ou dokîmow signifies an instrument

for testing, and is applied by Plato to

the small blood-vessels of the tongue,

which he holds to be both the cause of

taste, through their contraction and ex-

pansion, and also the means of trans-

mitting the páthima to the seat of con-

sciousness. Of the nerves Plato, like

Aristotle, understood nothing at all: their

functions are attributed by him to the

phlébsia.

5. kaptatkhómea] Plato holds that

all taste is produced by substances in a

liquid state, whether liquefied before or

after entering the mouth. In this opinion

Aristotle coincides; see for instance de

anîma 11 x 422a 17 oûthen de poiêi xhîmôv

aîôsthsean aneiv ñrôntos, alîtâ êxei ènrr-

gelh ò dúvamiês ñrôntos. Aristotle's theory

taste will be found in that chapter.

6. strufnvâ…aîôsthra] The first of these

words evidently means 'astringent':
aîôsthra may be translated 'harsh'; but

possibly it answers more to our 'bitter'

than pikrâ: at least we should hardly

call soda bitter. The same word is ap-

plied to alkaline flavours by Aristotle

de sensu in 441b 6. pikrôn is defined by

Theophrastos 1. 1. as fâvarthikov tîs ñrô-

ntos ò fêktikov ò ãplôs traxhûn ò ãplôs

traxhûn.

12. filâ mállon ÿmîn fàntâkeîn] This is mentioned because all the sub-

stances hitherto enumerated, including

salt, have a disturbing action upon the

substance of the tongue, and are there-
like most other things, are brought about by contraction and dilation, besides which they have more to do than other sensations with roughness and smoothness in the agents. For whenever earthy particles enter in by the little veins which are a kind of testing instruments of the tongue, stretched to the heart, and strike upon the moist and soft parts of the flesh, these particles as they are being dissolved contract and dry the small veins; and if they are very rough, they are termed 'astringent'; if less so 'harsh'. Such substances again as are detergent and rinse the whole surface of the tongue, if they do this to an excessive degree and encroach so as to dissolve part of the structure of the flesh, as is the property of alkalis—all such are termed 'bitter': but those which fall short of the alkaline quality and rinse the tongue only to a moderate extent are saline without bitterness and seem to us agreeable rather than the reverse. Those which share the warmth of the mouth and are softened by it, being simultaneously inflamed and themselves in turn scorching that which heated them, and which owing to their lightness fly upward to the senses of the head, penetrating all that is in their path—owing to these properties all such substances are called 'pungent'. But sometimes these same substances, having been already refined by decomposition, enter into the narrow veins, being

fore presumably disagreeable. The irritation produced by salt is however so mild that it amounts to no more than a pleasant stimulation of the organ.

13. τὰ δὲ τῇ τοῦ στόματος θερμότητι]
Compare the view assigned to Alkmaion by Theophrastos de sensu § 25: γλώττη δὲ τῶν χυμονό κρίνειν χλαράν γὰρ οὕσαν καὶ μαλακὴν τῆκεν τῇ θερμότητι: δέχεσθαι δὲ καὶ διαδίδοναι διὰ τὴν μανότητα τῆς ἀπαλότητος.

15. πρὸς τὰς τῆς κεφαλῆς αἰσθήσεις]
A spoonful of strong mustard would probably produce very much the sort of experience which Plato describes. Theophrastos says ὅμοιον δὲ τῶν πηκτίκων ἡ δηκτικῶν ἡ ἐκκριτικῶν τῆς ἓν τῇ συμφώτῳ ὑγρότητι θερμοτήτος εἰς τῶν ἀνώ τῶν ἡ ἀπλῶς χυμῶν καυτῶν ἡ θερμαντικῶν.

There seems a lack of finish in his definition.

17. τῶν δὲ αὐτῶν προλεπτυσμῶν]
In this portentous sentence it is quite probable that some corruptions may lurk. But no emendation suggests itself of sufficient plausibility to justify its admission into the text, although I have little doubt that ἔχοντων should be read for ἔχοντα. Stallbaum's proposed alterations are the result of his not understanding the construction: δοὰς ἄφρος is parallel to τοῖς γεώδεσι and equivalent to τοῖς δοὰς ἄφρος ἐνεστῶν. As for the infinitives after ἀ, ἰ, they are incurably ungrammatical: we must either suppose that the construction is carried on from ἐλέξῃ in the previous sentence, or that it never recovers from the effects of ὤστε
early in the present one. However loose the syntax may be, the sense is not on the whole obscure. Acids are substances which have been refined by fermentation; these, when they enter the mouth, form a combination with the particles of earth and air which are therein, and stir and mix them up in such a way as to produce films of moisture enclosing air, in other words, bubbles: a kind of effervescence in fact is produced by the action of the acid on the substance of the tongue. The words eis ̵̵et ̵̵n̵̵o̵̵m̵̵e̵̵n̵̵a ̵̵e̵̵t̵̵e̵̵ra ̵̵k̵̵o̵̵i̵̵a̵̵ ̵̵a̵̵p̵̵e̵̵r̵̵γ̵̵ά̵̵ζ̵̵ε̵̵θ̵̵αι̵̵ ̵̵π̵̵ε̵̵ρ̵̵ε̵̵ι̵̵ν̵̵όμ̵̵ε̵̵αι̵̵ τ̵̵ω̵̵ς̵̵ ε̵̵ι̵̵σ̵̵ι̵̵ο̵̵σ̵̵ι̵̵μ̵̵, ̵̵α̵̵ π̵̵ή̵̵ς̵̵ ν̵̵ε̵̵ι̵̵ ̵̵π̵̵ε̵̵ρ̵̵ί̵̵τ̵̵ε̵̵ι̵̵ς̵̵, ̵̵ο̵̵τ̵̵ε̵̵ρη̵̵ά̵̵ρ̵̵ι̵̵δ̵̵α̵̵γ̵̵ά̵̵θ̵̵αι̵̵ τ̵̵ω̵̵ς̵̵ κι̵̵ν̵̵ά̵̵σ̵̵θ̵̵αι̵̵, ̵̵δ̵̵ή̵̵ ν̵̵ο̵̵τ̵̵ί̵̵δ̵̵ο̵̵ς̵̵ π̵̵ε̵̵ρ̵̵ί̵̵ θ̵̵έ̵̵ρ̵̵α ̵̵δ̵̵Κ̵̵ο̵̵ ̵̵ν̵̵ό̵̵μ̵̵α̵̵ ο̵̵μ̵̵ο̵̵ κι̵̵ν̵̵ά̵̵σ̵̵θ̵̵αι̵̵, ̵̵τ̵̵ά̵̵ δ̵̵έ̵̵ τ̵̵ή̵̵ς̵̵ κα̵̵θ̵̵ά̵̵ρ̵̵άς̵̵ δι̵̵α̵̵φα̵̵νέ̵̵ι̵̵ς̵̵ π̵̵ε̵̵ρ̵̵ι̵̵τ̵̵ή̵̵ν̵̵αι̵̵ κ̵̵λ̵̵θ̵̵ε̵̵θ̵̵ε̵̵ς̵̵ ο̵̵ν̵̵όμ̵̵α̵̵ π̵̵ο̵̵μ̵̵φ̵̵ό̵̵λ̵̵υ̵̵ς̵̵, ̵̵τ̵̵ά̵̵ δ̵̵έ̵̵ τ̵̵ή̵̵ς̵̵ γε̵̵ώ̵̵δ̵̵ου̵̵ς̵̵ ό̵̵μ̵̵ο̵̵ κι̵̵ν̵̵ω̵̵μ̵̵έ̵̵ν̵̵η̵̵ς̵̵ τ̵̵ε̵̵ι̵̵ και̵̵ α̵̵ι̵̵ρ̵̵ο̵̵μ̵̵έ̵̵ν̵̵η̵̵ς̵̵ ζ̵̵έ̵̵σ̵̵ι̵̵ τ̵̵ε̵̵ και̵̵ γ̵̵ύ̵̵μ̵̵ω̵̵σ̵̵ι̵̵ν̵̵ ἐ̵̵π̵̵ί̵̵κ̵̵λ̵̵η̵̵ν̵̵αι̵̵—τ̵̵ά̵̵ δ̵̵έ̵̵ τ̵̵ο̵̵υ̵̵τ̵̵ω̵̵ν̵̵ άι̵̵τ̵̵ί̵̵ω̵̵ν̵̵ τ̵̵ῶ̵̵ν̵̵ παθ̵̵η̵̵μ̵̵ά̵̵τ̵̵ω̵̵ν̵̵ ἀ̵̵ξ̵̵ι̵̵ν̵̵ο̵̵μ̵̵ε̵̵ν̵̵ κ̵̵έ̵̵κ̵̵λ̵̵η̵̵τ̵̵αι̵̵ γ̵̵λ̵̵υκ̵̵.̵̵

XXIX. Καί τα μέν ταύτη ταύτα περί δέ δή τήν τῶν δῦναμιν, εἴδη μὲν οὐκ ἐνι: το γὰρ τῶν ὁσμῶν πάν ἡμιγενές, εἴδει δὲ οὐδενὶ ξυμβέβηκε ξυμμετρία πρὸς τὸ τινα ἔχεων

12 λεινη: λεινην ASZ. 17 δή ποστ τα μέν addit S. 19 ἔχεων: σχεῖν ΣΖ.
duly proportioned to the earthy particles and the particles of air which are there, so that they set them in motion and mingle them together, and thereby cause them to jostle against one another and taking up other positions to form new hollows extended round the entering particles—which hollows consist of a film of moisture, sometimes earthy, sometimes pure, embracing a volume of air; and thus they form moist capsules containing air:—in some cases the films are of pure moisture and transparent and are called bubbles; in others they are of earthy liquid which effervesces and rises all together, when the name of seething and fermentation is given to it: and the cause of all these conditions is termed 'acid'. The opposite affection to all those which have been described is produced by an opposite cause: when the structure of the entering particles amid the moisture, having a natural affinity to the tongue's normal condition, smooths it by mollifying the roughened parts, and relaxes or contracts what is unnaturally contracted or expanded, and settles everything as much as possible in its natural state. Every such remedy of violent affections is to all of us pleasant and agreeable, and has received the name of 'sweet'.

XXIX. Enough of this subject. As regards the faculty of the nostrils no classification can be made. For smells are of a half-formed nature: and no class of figure has the adaptation requisite for producing any smell, but our veins in this

lution. The object of smell then is either vapour, which is water changing to air, or mist, which is air changing to water. That the object of smell is denser than air can be proved by placing some obstacle before the nostrils and then forcibly drawing breath: the air will pass in, but without any odour. The only classification we can make is that scents which disturb the substance of the nostrils are unpleasant, while those which restore the natural state are pleasant.

Sound is a vibration of the air, impinging upon the ear and thence transmitted first to the brain and finally to the liver: the pitch depends upon the rapidity, the quality upon the regularity, and the loudness upon the extent of the motion.

19. ἐἰδεὶ δὲ οὖδεν[ ] That is, it does not possess the structure of any of the four, fire, air, water, and earth. We were able to classify tastes, because we could point to a definite substance which caused the sensation in each case. Aristotle agrees with Plato that the sense of smell ἄνωμον εὐφύεστον ἡσυχία, de anima ii ix 421a 7: this he attributes to the fact that mankind possesses this sense in a very imperfect degree, being in this respect inferior to many animals. In the same chapter 421b 9 he says air or water is the medium of smell: ὅτι δὲ καὶ ἡ δόξησις ἀπὸ τοῦ μεταχείν, ἄνω αέρος ἡ ἐνατος καὶ γάρ τὰ ἑνώρα δοκούσιν ὡς ὅμοιοι αἰσθανεῖσθαι. Elsewhere Aristotle denies that smells cannot be classified: de sensu ν
The sense of smell then perceives matter in an intermediate condition, as it is passing from one form to another. Heracliteanism seems to have held some similar view: see Aristotle *de sensu* ν 443b 23 ἰδίῳ καὶ Ἰακόπλεον ὄντως εὑρεθεν, ως ἐλάττων τὰ ἑντὰ καπνὸς γένους, ρίζες δὲ διαγροῦσι. Plato's doctrine of smell, however, when considered in connexion with his corpuscular theory, has a striking peculiarity. Only ὠσχίς and καπνὸς can be smell, he says. But what are ὠσχίς and καπνὸς? We cannot say simply that ὠσχίς is the densest form of air and καπνὸς the rarest form of water, because Plato expressly tells us that they are transitional forms between air and water. Now the densest form of air is still formed of octahedrons, and the rarest form of water still formed of icosahedrons; so that no condensation of the one or rarefaction of the other constitutes any approach to a transition between the two. Now since ὠσχίς and καπνὸς are not composed either of octahedrons or of icosahedrons, of what nature are the material particles which smell perceives? for no other regular solid figure beyond the five exists in nature. We are compelled to suppose that the agent which excites smell is actually unformed matter—matter, that is, which is dissolved out of one form, but not yet remoulded in another. It is evident that if the particles of water are dissolved and remoulded as particles of air, this is a physical process taking place in time: there is a time therefore when matter does exist in an unformed condition; and just in this time smell has the power of perceiving it. Aristotle, whose objections to the theory are stated in the chapter of the *de sensu* above cited, has nothing to say about this.

4. *γνωρονταί* sc. at δέμαλ.

7. τὸ μὲν εἶς ἄδερος] Aristotle puts it rather differently: *meteorologica* 1 ix
part are formed too narrow for earth and water, and too wide for fire and air: for which cause no one ever perceived any smell of these bodies; but smells arise from substances which are being either liquefied or decomposed or dissolved or evaporated: for when water is changing into air and air into water, odours arise in the intermediate condition; and all odours are vapour or mist, mist being the conversion of air into water, and vapour the conversion of water into air; whence all smells are subtler than water and coarser than air. This is proved when any obstacle is placed before the passages of respiration, and then one forcibly inhales the air: for then no smell filters through with it, but the air bereft of all scent alone follows the inhalation. For this reason the complex varieties of odour are unnamed, and are ranked in classes neither numerous nor simple:

theory of smell which we have been discussing. Martin curiously misunderstands this sentence, supposing that two people are concerned in the experiment: but τοῦτος ἀντιφραχθέντος is of course neuter—’if an obstacle be placed’. It would seem then as if Plato conceived matter in its passage from air to water, or from water to air, to be made up of irregular figures intermediate in size between the particles of air and those of water: but how this comes about he does not explain. Theophrastos says curiously enough) in δε σεισσε § 6 περὶ δὲ ὀσφρήσεως καὶ γεύσεως καὶ ἀφής ὅλως ὀὐδὲν εἰπηκεν [ὁ Πλάτων]: he means probably that Plato’s account treats more of the αἰσθήτων than the αἰσθησις: μὰλλον ἀκριβιβολεῖται περὶ τῶν αἰσθητῶν: still the statement cannot be considered accurate.

12. δι’ οὖν ταῦτα] Although all the mass. agree in giving δι’ οὖν, it is impossible to retain it. For the δι’ εἰδὴ could only refer to the two divisions specified below, which are not ἀνώνυμα, but ἡδον and ἀπειρίαν. It is the endless diversity of different scents that fall under these two heads—τὰ τοῦτον ποικιλματα—which are ἀνώνυμα.

13. οὐκ ἐκ πολλῶν] Tastes were divided into numerous species, which were
unta, allα διχη το θ' ὑδν και το λυπηρων αυτωθι μονω διαφαιη λέγεσθον, το μεν τραχύνου τε και βιαζόμενον το κύτος ἄπαν, ὅσον ἡμῶν μεταξυ κορυφής του τε ὄμφαλοι κείται, το δε ταυτω τοτο καταπραυνου και τάλιν ἕτενεις ἀγαπητως ἀποδιδου.

5 Τρίτον δε αἰσθητικον ἐν ἡμων μέρος ἐτισκοποου το περι την ἀκοην, δι' αιτιας τα περι αυτο ἐξυμβαίνει παθήματα, λεκτέων. Β ὄλως µεν ουν φωνη θώμεν την δι' ὅτων υτ' αέρος ἐγκεφάλου τε και αἴματος μέχρι ψυχῆς πληγῆν διαδιδομένην, την δε υπ' αυτης κίνησιν, ἀπ' της κεφαλῆς µὲν ἀρχομένην, τελευτώσαν δε περι την τοι ήπατος ἐθραυ, ἀκοην ὅση δ' αυτης ταχεια, ὄξειαν, ὅση δε βραδυτέρα, βαρυτέραν την δε όμοιαν όμαλην τε και λειαν, την δε ἐναυτιαν τραχειαν μεγάλην δε την πολλην, ὅση δε ἐναυτια, σ σμικραν, τα δε περι Ἑὔμφβανιας αυτῶν εν τοῖς ύπερνον λεχθησο- µένως ανάγκη ρηθήναι.

15 XXX. Τέταρτον δη λοιπων ετι γένους ἡμων αἰσθητικον, δ ἀπλα, because we could name the precise kind of substance which produced each and the mode of its action: smells are not ἀπλα, because they do not proceed from any definite single substance, nor πολλα, because we can only classify them as agreeable or the reverse. Although a stricter classification than this can be made, Plato rightly regards taste as much more ἀπλοι than smell. For the more complex flavours which we 'taste' are really perceived by smell.

2. το µιν τραχυνον Plato's classification is based on his broad distinction between irritant and soothing agents.

3. μεταξυ κορυφης του το ομφαλου This must apply to extremely pungent and volatile scents, such as the fumes of strong ammonia: compare the description of δρυμα in 65 ε.

7. την δε οτων Plato's account of sound is in many respects consonant with modern acoustic science. He is correct in attributing it to vibrations which are propagated through the air until they strike upon the ear, and in saying that the loudness of the sound is proportionate to the amplitude of the sound-wave (μεγαλην δε την πολην). He is also right in referring smoothness in the sound to regularity of the vibrations; for this is what constitutes the difference between a musical sound and mere noise; in the former case the vibrations are executed in regular periods, in the latter they are irregular. His explanation of the pitch is correct if by 'swiftness' he means the rapidity with which the vibrations are performed, but erroneous if he refers to the celerity of the sound's transmission through the air: from 80 α, β it would appear that he included both, supposing the more rapid vibrations to be propagated more swiftly through the atmosphere.

ἐγκεφάλου τε και αἴματος] The construction of all these genitives is a little puzzling. Stallbaum constructs ἐγκεφάλου τε και αἴματος with δια, but the interposition of ὑπ' αέρως surely renders this indefensible. I think we should join the words with πληγην: 'a striking of the brain and blood by the air through the ears'. Plato conceives the vibrations, entering through the ears, to reach the brain and to be from thence transmitted
only two conspicuous kinds are in fact here distinguished, pleasant and unpleasant. The latter roughens and irritates all the cavity of the body that is between the head and the navel; the former soothes this same region and restores it with contentment to its own natural condition.

A third organ of sensation in us which we have to examine is that of hearing, and we must state the causes whence arise the affections connected with it. Let us in general terms define sound as a stroke transmitted through the ears by the air and passed through the brain and the blood to the soul; while the motion produced by it, beginning in the head and ending in the region of the liver, is hearing. A rapid motion produces a shrill sound, a slower one a deeper sound; regular vibration gives an even and smooth sound, and the opposite a harsh one; if the movement is large, the sound is loud; if otherwise; it is slight. Concerning accords of sound we must speak later on in our discourse.

XXX. A fourth faculty of sense yet remains, the intricate through the blood-vessels to the liver. The liver appears to be selected because that region is the seat of the nutritive faculty of the soul, 70 D: and since the sensation of sound, as such, does not appeal to the intellectual organ, it is transmitted to that faculty which is specially concerned with sensation.

13. τὸ δὲ περὶ ἐμφανίας] The account of concords is given in 80 A, where the transmission of sounds is explained. Aristotle's opinions concerning sound will be found in de anima II viii 410b 4 foll., and scattered through the treatise de sensu.

67 c—69 A, c. xxx. The process of vision has already been explained: it only remains to give an account of colours. The particles which stream off from the objects perceived are some of them larger than those which compose the visual current, some smaller, and some of equal size. In case they are equal, the object whence they proceed is colourless and transparent; if they are smaller, they dilate the visual current; if larger, they contract it. White is produced by dilation, black by contraction. Brightness and gleaming are the effects of a very swift motion of the particles, which divide the visual stream up to the very eyes themselves and draw forth tears. Red is the product of another kind of fire which penetrates the visual stream and mingles with the moisture of the eye. The other colours, yellow, violet, purple, chestnut, grey, buff, dark blue, pale blue, green, are produced by combinations of the aforesaid, but in what proportions mingled God alone knows.

The physical processes we have been describing belong to the rank of subsidiary causes. For we must remember that there are in nature two classes of causes, the divine and the necessary; whereof we must search out the divine for the sake of happiness, and the necessary for the sake of the divine.

15. ἀλοθητικόν] It is again a question whether we ought not to read ἀλο- θητον, since colours are the object of investigation. Here however I think the
ms. reading is defensible: we have, says Plato, to examine a fourth faculty of sense, which has various οὐκίλματα: the οὐκίλματα being the sensations we call colours. But he passes immediately from the subjective to the objective aspect of χρόαι, φλόγα τῶν σωμάτων ἐκάστων ἀπορρέουσαν, οὔτε ξύμμετρα μόρια έξουσιοι πρὸς αὐθεσθείσιν. οὔτε ἦν τοῖς πρόσθεν αὐτῷ περὶ τῶν αιτίων τῆς γενέσεως ἥρρηθ. τῇ δ' ὅ 5 οὖν τῶν χρωμάτων περὶ μάλιστα εἰκὸς πρότειν τ' ἀν τῶν ἐπεικείμενοι λόγους διεξελθεῖσι, τὰ φερόμενα ἀπὸ τῶν ἀλλῶν μόρια ἐμπίπτοντα τε εἰς τὴν όψιν τὰ μὲν ἐλάττω, τὰ δὲ μείζω, τὰ δ' ἵσα τοῖς αὐτίς τῆς οὔφεως μέρεσι εἶναι τα μὲν οὖν ἵσα ἀναλογείναι, ἢ δὴ καὶ διαφανῶς λέγομεν, τὰ δὲ μείζω καὶ ἔλαττο, τὰ μὲν συγκρίνοντα, τὰ 10 δὲ διακρίνοντα αὐτίς, τοῖς περὶ τὴν σάρκα θερμοῦς καὶ ψυχροῦς καὶ τοῖς περὶ τὴν γηλότταν στρυφνοῖς καὶ ὧνα θερμαντικὰ ἴνα δριμέα ἐκάλεσαμεν ἀδελφά εἶναι, τὰ τε λευκά καὶ τὰ μέλανα, ἐκεῖνοι παθήματα γεγονότα ἐν ἄλλῳ γένει τὰ αὐτὰ, φανταξόμενα δὲ ἄλλα διὰ ταύτας τὰς αἰτίας. οὖν πολὺ αὐτά 15 προσρητεύον; τὸ μὲν διακριτικὸν τῆς οὔφεως λευκόν, τὸ δ' ἐναντίον αὐτοῦ μέλαν, τὴν δὲ ἀντικείμενον στροφῆς ἀπερώνειν πρ" 4 αὐτὸ Α. αὐτῶν HSZ. ἀλγα post γενεσεὶς ε marginale codicis A dedit H. eici cum SZ. 5 τῶν ἐπεικείμενοι λόγοι scripsi: τῶν ἐπεικείμενοι λόγφι ΛΗ. ἐπεικείμενοι λόγφι SZ. sed forsi tantum melius legatur πρότειν τ' ἀν ἐπὶ εἰς λόγφι.

3. οὔφει ξύμμετρα μόρια] i.e. particles of the right size to coalesce with the οὔφεως ρέμα and form with it one sympathetic body. Stallbaum says Plato is following Empedokles, but this is incorrect: see Theophrastos de sensu § 7 'Εμπεδοκλῆς δὲ περὶ ἀπασῶν ὁμιλοῦσιν λέγει καὶ φρέσκο τῷ ἐναρμόττειν εἰς τοὺς πόρους τῶν ἐκάστης αἰσθάνεσθαι: cf. pseudo-Plutarch de placitis philosophorum 1 15. The views of Aristotle concerning colour may be gathered from de sensu iii 439a 18 foll. and from the not very luminous treatise de coloribus. Aristotle considered the beauty of colours to depend upon numerical ratios: see de sensu iii 439b 31 τὰ μὲν γὰρ ἐν ἀριθμοῖς εὐθυγράμμοις χρώματα, καθαρέρεικὲς τὰς συμφωνίας, τὰ ηδίστα τῶν χρωμάτων εἶναι δοκοῦντα, οἷον τὸ ἄλογρον καὶ φωνικόν καὶ ὀλγή ἄττα τουαύτα, δὲ ἵστερ αἰτιᾶν καὶ αἴ συμφωνία ὀλγαί, τὰ δὲ μὴ ἐν ἀριθμοῖς ταλλὰ χρώματα, ἢ καὶ πάσας τὰς χρώσ ἐν ἀριθμοῖς εἶναι, τὰς μὲν τεταγμένας τὰς δὲ ἀπάκτους, καὶ αὐτὰς ταύτας, ὅταν μη καθαρὰ ἤτοι, διὰ τὸ μὴ ἐν ἀριθμοῖς εἶναι ταύτας γίνεσθαι. This has rather a Pythagorean sound.

6. τὰ φερόμενα ἀπὸ τῶν ἀλλῶν μόρια] i.e. the particles of fire which stream off from the object: it must be remembered that Plato's conception differs from the Demokritean or Empedoklean effluences, inasmuch as he does not hold that any image of the object is thrown off. τῷ ὀψιν again =τῷ τῆς όψεως ρέμα. 8. τὰ μὲν οὖν [ίσα] Colours are then classified according to the relative size of the fiery particles from the object. If they are equal to those of the visual stream, we perceive no colour, but transparency alone: if smaller, so that they penetrate and dilate the οὔφεως ρέμα, the
varieties of which it is our part to classify. To these we have given the name of *colours*, which consist of a flame streaming off from every object, having its particles so adjusted to those of the visual current as to excite sensation. We have already set forth the causes which gave origin to vision: thus therefore it will be most natural and fitting for a rational theory to treat of the question of colours. The particles which issue from outward objects and meet the visual stream are some of them smaller, some larger, and some equal in size to the particles of that stream. Those of equal size cause no sensation, and these we call *transparent*; but the larger and smaller, in the one case by contracting, in the other by dilating it, produce effects akin to the action of heat and cold on the flesh, and to the action on the tongue of astringent tastes and the heating sensations which we termed pungent. These are *white* and *black*, affections identical with those just mentioned, but occurring in a different class and seeming to be different for the causes aforesaid. We must then classify them as follows. What dilates the visual stream is white, and the opposite thereof is black. A swifter motion belonging to a different kind of fire, which meets and

colours produced are light and bright; if they are larger and compress the stream, the colours tend to be dark.

**ἀναλόθητα**] Since the particles are equal to those of the visual current, they do not affect the homogeneous structure of the latter.

10. τοῖς περὶ τὴν σάρκα] Plato merely means that the physical processes of contraction and dilation are the same in both instances; for in the other cases mentioned the sensations are pleasant or unpleasant, whereas the phenomena of vision are, physically regarded, unaccompanied either by pleasure or by pain.

13. ἐκείνων παθήματα] I take ἐκείνων to refer to τὰ συγκρίνοντα καὶ διακρίνοντα: the *παθήματα* belonging to the objects affecting the eye are the same as the *παθήματα* belonging to the objects of taste &c, namely σῶματα καὶ διάφανα. For the use of παθήματα compare 61c, where παθήματα are the properties where-by sensibles excite sensation. Stallbaum, following Stephanus, understands ἐκείνων to refer to θερμὰ and ψυχρὰ, στριφτὰ and ὀψιμένα, but this does not appear to me to give so good a sense. ἐν ἄλλῳ γένειν in another organ or mode of sensation. It is not generally recognised, Plato means, that the process is the same in the case of sight as in that of taste, because the sensible effect is so widely dissimilar.

14. διὰ ταύτας τὰς αἱτίας] i.e. because they are ἐν ἄλλῳ γένει and are not attended by pleasure or pain.

16. τὴν δ’ ἔξωτεραν] Bright is distinguished from white (1) by dissimilarity between its fiery particles and those of white, (2) by its more rapid motion. It penetrates the ὄψις ἀείμα right up to the eyes, the pores of which it displaces and dissolves, drawing forth a mixture of fire and water which we call tears. And so when the entering and issuing fires mingle and are quenched in the
moisture, an agitation of the eyes is produced which we call 'dazzling'. As regards πῦρ ἄθρόν καὶ ὑδρόν we must remember that, as Martin remarks, Plato considered all liquid water, and especially of course warm water, to be a mixture of fire and water; cf. 59 D.

8. τὸ δὲ τούτων αὐτῇ i.e., intermediate between the fire producing λέυκον and that producing στίλβον.

10. τῆς τοῦτον αὐτῇ The reading of the ms. cannot be construed. I think it is necessary to receive μεγνυμένου and παρασχύμενον, agreeing with γένος. The sense will then be, the rays arriving at the eye, as their fire mingles with the gleam pervading the moisture which is there (i.e. with the fire residing in the eye itself), give it a blood-red colour. Stallbaum, accepting μεγνυμένου, oddly enough retains παρασχυμένη. [10] τὸ δὲ ὄσον μέτρων] To give the exact proportions of the mixture is beyond the power of science and is not requisite κατὰ τὸν ἐκόλοθον λόγον: cf. below, 68 n.

16. ὅρφυνον This is probably a very deep shade of violet: compare Aristotles de coloribus ii 792a 25 ἐντευθείσα γάρ πας πρὸς τὸ φῶς ἀλυσίν ἐχεῖ τὸ χρώμα ἑλάττωνς τὸ νῦν φωτός προσβάλλουσαν ζοφερόν, δὲ καλὸν ὅρφυνον. The word occurs again in the same form in chapter iv 794b 5. See too Xenophon Cyropædia viii iii 3 ὀόσον φειδέμενον ἀπερφυρίδων ὁ τε ὅρφυνον ὁ τε φοινικίδων ἀπερφυρίδων φοινικίδων (red-sauce-coloured) ματιῶν. It seems to have been an expensive
tint much in vogue among people who dressed handsomely: cf. Athenaeus XI 50, where it appears to represent the colour of the midnight star-lit sky. As regards ἀλουργόν, it may be noted that this is the same combination which is assigned by Demokritos to πορφυρών: Theophrastos de sensu § 77 ὃ ἔ θ ὁ πορφυρών ἐκ λευκοῦ καὶ μύλαν καὶ ἐρυθροῦ, πλειστῶς μὲν μόριαν ἔχοντος τοῦ ἐρυθροῦ, μικράν δὲ τοῦ μύλανος, μέσην δὲ τοῦ λευκοῦ. A summary of the opinions of Demokritos concerning colour is given in §§ 73—78.

17. πυρρόν δὲ] This is a bright reddish brown, chestnut or auburn. φαιῶν is a dusky grey: ᾨρῶν an ochreous yellow or buff.

20. εἰς μέλαν κατακόρες] i.e. an intense, absolute black; the substance being, as it were, saturated with as much black as it can contain. This is a technical term to express vividness of colour: cf. Aristotle de coloribus ν 795 ι μᾶλλον μὲν ὁν τοῦ ἵππου μελαιομένου τὸ πόωδες γίνεται κατακόρες ἰσχυρῶς καὶ πρασοείδες.

κυανοῦν χρώμα] Dark blue. Demokritos gives a different account: Theophrastos l. l. ὃ ἐξ θανάτος (the blue colour obtained from woad) καὶ πυρώδους. By γλαυκον a light blue is evidently meant. The elaborate distinctions of colour drawn in the present chapter certainly do not tend to support the theory which has been put forward that the Greeks were deficient in the colour-sense: indeed it is somewhat difficult to get a sufficient number of English terms to translate the Greek names.
kuanou δὲ λευκό κερανυμένου γλαυκόν, πυρρόν δὲ μέλαν πράσινον. τὰ δὲ ἀλλὰ ἀπὸ τούτων σχέδων ἁλτα, αἰς ἃν ἀφομοιοῦμενα μέξιμον διασόζοι τὸν εἰκότα μῦθον, εἰ δὲ τις τούτων ἔργῳ σκο-πούμενος βίασανο λαμβάνοι, τὸ τῆς ἀνθρωπίνης καὶ θείας φύσεως ἤγιον κος ἀν εἰ ἁδύφορον, ὅτι θεός μὲν τὰ πολλά εἰς ἐν ἔνυκρεννύναι καὶ πάλιν εὖ εἰς πολλά διαλύειν ἰκανός ἐπιστάμενος ἄμα καὶ δυνάτος, ἀνθρώπων δὲ οὐδέσι οὐδέτερα τούτων ἰκανός οὔτε ἐστὶ νῦν οὔτ' εἰσαύθις ποτ' ἔσται. ταῦτα δὴ πάντα τότε ταύτη θεφύκοτα εὖ ἀνάγκης ὑ ὅ τοῦ καλλίστου τε καὶ ἀριστοῦ δημιουργὸς ἐν τοῖς γνωρομένοις παρελάμβανεν, ἵνα τὸν αὐτάρκη τε καὶ τὸν τελεωτατον θεόν ἐγένεσα, χρώμενος μὲν ταῖς περὶ ταῦτα αἰτίαις ὑπηρετούσας, τὸ δὲ εὖ τεκταίωμένος ἐν πάσι τοῖς γνωρομένοις αὐτός. διὸ δὴ χρὴ δ' αἰτίας εἰδὴ διορίξεσθαι, τὸ μὲν ἀναγκαῖον, τὸ δὲ θείον, καὶ τὸ μὲν θείον ἐν ἀπαίσιν θετείς ἑκείνη εὐδαιμονίας, καθ' ὅσον ἡμῶν ἡ φύσις ενδέχεται, τὸ δὲ ἀναγκαῖον 69 Α ἐκείνων χάριν, λογιζόμενον, ὥσ ἄνευ τούτων ὡς δυνατὰ αὐτὰ ἐκείνα, ἐφ' οἷς σπουδάζομεν, μόνα κατανοεῖν οὐδ' αὐτ' λαβεῖν οὐδ' ἀλλος πῶς μετασχεῖν. 

6 Ικανός: Ικανός ὃς SZ. 10 λογιζόμενον: λογιζόμενον SZ.

1. πυρρόν δὲ μελαν πράσινον] This certainly seems an exceedingly odd combination. πράσινον is bright green, or leek-colour; and a mixture of chestnut and black appears very little likely to produce it. Aristotle more correctly classes green, along with red and violet, as a simple colour: see meteorologia III 2 372a 5 ἴστι δὲ τὰ χρώματα ταῦτα ἄπερ μόνα σχεδὸν οὐ δύναται ποιεῖν οἱ γραφῆς ἐνα γὰρ αὐτὸς κερανυννύοις, τὸ δὲ φυ- νικοῦ καὶ πράσινου καὶ ἄλογόν οὐ γίγνεται κερανυννύον. ἦ δὲ ἴσα ταῦτ' ἐχεῖ τὰ χρώματα: τὸ δὲ μεταξύ τοῦ φυσικοῦ καὶ πράσινου φαίνεται πολλάκις ξανθόν. Accord- ing to Demokritos πράσινος is ἐκ πορ- φυροῦ καὶ τῆς ισάτιδος, ἢ ἐκ χλωροῦ καὶ πορφυροειδοῦς: combinations which seem hardly better calculated than Plato's for producing the desired result. 

5. θεὸς μὲν] God, says Plato, can detect in the multifarious diversity of particulars one single form underlying them all; and again he can trace the development of that form through all the ramifications of its manifold appearances. Plato here probably has in view the problem of ἐν καὶ πολλὰ as presented by the methodical investigation of physical phenomena; the tendency of his later thought was however to the conclusion that the problem is one which can only approximately be grasped by finite intelligence. Compare 83 c.

11. αἰτίαις ὑπηρετοῦσαῖς] cf. supra 48 c, Phaedo 99 a, Politicus 281 d. 

13. τὸ μὲν ἀναγκαῖον, τὸ δὲ θείον] The distinction between the two sorts of causes is obvious enough. The ἀναγκαῖον includes all the subsidiary causes, the physical forces and laws by means of which Nature carries on her work: the θείον is the final cause, the idea of τὸ βαθύτατον as existing in absolute intelligence. The operation of ἀνάγκη is to be studied either, as we were told at 59 c, for the sake of rational recreation, or more seriously, as we now
deep blue mingled with white produces pale blue; and chestnut with black makes green. And for the remaining colours, it is pretty clear from the foregoing to what combinations we ought to assign them so as to preserve the probability of our account: but if a man endeavour to make practical trial of these theories he will prove himself ignorant of the difference between divine and human intelligence: that God has sufficient understanding and power to blend the many into one and again to resolve the one into many; but no man is able to do either of these, now or henceforth for ever.

All these things being thus constituted by necessity, the creator of the most fair and perfect in the realm of becoming took them over, when he was generating the self-sufficing and most perfect god, using the forces in them as subservient causes, but himself working out the good in all things that come into being. Wherefore we must distinguish two kinds of causes, one of necessity and one of God: and the divine we must seek in all things for the sake of winning a happy life, so far as our nature admits of it; and the necessary for the sake of the divine, reflecting that without these we cannot apprehend by themselves the other truths, which are the object of our serious study, nor grasp them nor in any other way attain to them.

learn, as a stepping-stone to the knowledge of the θεῖον. This passage contains the strongest expression which is to be found in Plato in favour of the investigation of phenomena, when he says that it is necessary to study subsidiary causes as an aid to the study of the final cause. Particulars are nothing else but the form in which the ideas are made manifest to our bodily senses; therefore the study of particulars, in its highest aspect, is the study of ideas. But the sole value of this study lies in its bearing on the knowledge of the ideal world: the physical inquiry regarded as an end in itself Plato estimates quite as low in the Timaeus as in the Republic.

69 A—70 D, c. xxxi. Now therefore that we have completed our account of the accessory causes which God employed in carrying out his end, let us bring our story to a fitting close by setting forth how he thereafter fulfilled his design. God found all matter without form or law, obeying blind chance. He inspired it form and order and made it to be a single universe, a living creature containing within it all things else that live. Of the divine he was himself the maker; but the creation of the mortal he committed to his children. And they, receiving from him the immortal essence, built for it a mortal body, bringing with it all the passions that belong to the flesh. And reason, which is immortal, they set in the head: but they made to dwell with it two mortal forms of soul, which they severed from the immortal by putting the neck to sunder them. And since the mortal form was twofold, they made the midriff for a wall to part the two: and they set emotion in the heart,
and appetite they chained in the belly. This they did that the nobler part should hear the voice of the reason and pass its commands through all the swift channels of the blood, and so might aid it in subduing the rebellious swarm of lusts and passions. And knowing that the heart, excited by fear or passion, would leap and throb vehemently, they devised the cool soft structure of the lungs for a cushion to soothe and sustain it in the time of need.

1. ἡλπι παράκειται] We have assorted our material by distinguishing the theia aitia from the ἀναγκαία and by enumerating the manifold forms of the latter. The use of ἡλπι is of course purely metaphorical, without any trace of the Aristotelian sense.

2. διυλασμένα] I can find no authority for using διυλασμένα, which Hermann keeps, in the sense here required. διυλίζεων is a late word signifying ‘to filter’.

3. ἑπί ἄρχην ἐπανελθωμεν] We here resume our account, interrupted at 47 E, of the operation of intelligence, which now acts through the created gods in the generation of human beings. At the same time Plato fulfills the promise made in 61 D of expounding σαρκός καὶ τῶν περὶ σάρκα γένεσιν ψυχῆς τω δόσω θυσίων.

4. τελευτὴν ἔδη κεφαλήν τε] Compare Phaedrus 264 C ἀλλὰ τὸ δεῦ χωρὶς ἐντολής τοῦ ἀναγκαίου δίκαιον εἶναι.] We have here a brief reference to the statements in 30 A. 42 D—43 A.
XXXI. Now therefore that the different kinds of causes lie ready sorted to our hand, like wood prepared for a carpenter, of which we must weave the web of our ensuing discourse, let us in brief speech return to the beginning and proceed once more to the spot whence we arrived at our present point; and so let us endeavour to add an end and a climax to our story conformable with what has gone before.

As was said then at the beginning, when God found these things without order either in the relation of each thing to itself or of one to another, he introduced proportion among them, in as many kinds and ways as it was possible for them to be proportionate and harmonious. For at that time neither had they any proportion, except by mere chance, nor did any of the bodies that now are named by us deserve the name, such as fire and water and the other elements: but first he ordered all these, and then out of them wrought this universe, a single living creature containing within itself all living creatures, mortal and immortal, that exist. And of the divine he himself was the creator; but the creation of mortals he delivered over to his own children to work out. And they, in imitation of him, having received from him the immortal principle of soul, fashioned round about her a mortal body and gave her all the body to

άτάκτως έξουσία] See note on 53 Α.
As to the construction, the accusative may be regarded as governed by the compound phrase συμμετρίας ένεπολη-σεν, as though Plato had written ένεπολη-μόσατο. We had a somewhat similar sentence in 37 δ, ἡμέρας γὰρ καὶ νύκτας καὶ μήνας καὶ ξυναυτοῦ, οὐκ δύσας πρὶν οὕρανω γενέθαι, τότε ἀνέκεινσε συμμετε-μένοι τὴν γένεσιν αὐτῶν μηχανάται.
10. οὕτη τῷ παράπαν οὐκομάσαν] Another shaft aimed at Demokritos: had fire and water received only just so much form as they might owe to τόχα, they could not even have been worthy of the names fire and water. The mere existence of such definite forms as fire air earth and water, even apart from their harmonisation into a single coherent κόσμος, could not have come to pass without the action of intelligence. Compare 53 β έξουσία μὲν έξουσία αὐτῶν ἄττα.
12. έξερχον εἴπ] cf. 30 c.
17. δραμα] Compare 44 ε δραμα αὑτὸ τοῦτο καὶ εὑπορεῖν ἔδοσαν. The notion of δραμα is not a vessel to contain the soul, but a means of her physical locomotion.

άλλο τε εἶδος...το θυτήτων] The nature of this θυτήτων εἶδος has been discussed in detail in my introduction to the Phaedo: a brief statement therefore of what I conceive it to mean may suffice here. The division into θείον and θυτήν is obviously identical with the division into λογιστικόν and ἀλογον in the Republic; and the subdivision of θυτήν corresponds to the subdivision of ἀλογον in that dialogue into θυμοειδές and ἐπιθυμη-
τικῶν, and to the nobler and baser steed in the Phaedrus. It seems to me certain that these three ἐυθή are but names for one and the same vital force manifesting itself in different relations. The intellect, seated in the head, is the soul acting by herself, performing her own proper function of thinking. But since she is brought into connexion with a material body, she must needs have πάθη which are concerned with that body. So then, if the θείον is her activity by herself, the θυτόν is her activity through the body; which activity Plato distributes into two classes of πάθη, one of which may be designated by the general term of emotions, the other by that of appetites. It will be noticed that this does not profess to give an exhaustive catalogue of the soul’s activities through body: for sensuous perceptions are a mode of her action through body which does not fall under either head. For reasons in support of this view of the relation of the ἐυθή I must refer to the introduction to the Phaedo aforesaid. The name θυτόν is applied by Plato to the lower ἐδος, because, though soul is in herself and in her own activity eternal, her connexion with any particular body is temporary, and so must her action through such a body be also. Galen comments upon the term θυτόν as follows: de plac. Hipp. et Plat. 1 x 794 πότερον κυρίοις ὄνομαξιν ἐρημεῖν ἐπὶ Τιμαῖο θυτὰ τὰ δό δό μέρη τῆς ψυχῆς ἢ ταύτην αὐτῶς ἐπιτρέξῃ τὰ προσχοροῦν ἀλανότοις ὦσιν ὡς χείρος τοῦ λογιστικοῦ καὶ ὡς κατὰ τὰ θυτὰ τῶν ζώων ἑνεργοῦν μόνον; Of this question he offers no determination, but that he raised the point is interesting.

1. δείνα καὶ ἀναγκαία] This and much more of the phraseology in the present passage is echoed from 42 λ. ἀναγκαία = necessarily inherent in their nature.

3. ἀφρον ἐῳμβοῦλω] Compare Laws 644 C, where pleasure and pain take the place of confidence and fear: δό δέ κεκτημένων ἐν ἐαυτῷ ἐῳμβοῦλω ἐναντίον τε καὶ ἀφρόν, ὁ προσαγορευμένος ἠδονή καὶ λύπη.

6. τὸ θυτὸν γένος] sc. τῆς ψυχῆς.

7. σεβόμενοι μιαίνει τὸ θείον] An-
ride in; and beside her they built in another kind of soul, even that which is mortal, having within itself dread and inevitable passions—first pleasure, the strongest allurement of evil, next pains, that scare good things away; confidence moreover and fear, a yoke of thoughtless counsellors; wrath hard to assuage and hope that lightly leads astray; and having mingled all these perforce with reasonless sensation and love that ventures all things, so they fashioned the mortal soul. And for this cause, in awe of defiling the divine, so far as was not altogether necessary, they set the mortal kind to dwell apart from the other in another chamber of the body, having built an isthmus and boundary between the head and the breast, setting the neck between them to keep them apart. So in the breast, or the thorax as it is called, they confined the mortal kind of soul. And whereas one part of it was nobler, the other baser, they built a party-wall across the hollow of the chest, as if they were marking off an apartment for women and another for men, and they put the midriff as a fence between them. That part of the other reason why the intellect should be in the head is given in 90 A. Galen de plac. Hipp. et Plat. vi 505 says that Hippocrates agreed with Plato in making three ἀρχαί, the head heart and liver: this view Galen himself defends against that of Aristotle and Theophrastos, who made the heart the sole ἀρχή: cf. Aristotle de inventute iii 469 g. See note on 73 B 3 γαρ τοῦ βίου δεσμοί τῆς ψυχῆς τῷ σώματι ξυποθεμένης ἐν τούτῳ διαδοθέμενοι κατερρίζουσι τὸ θητοῦ γένος.

ὅ τι μὴ πᾶσα ἡν ἀνάγκη] A certain loss of her divine nature is inseparable from the soul's differentiation and consequent material embodiment: all the gods could do was to reduce this to a minimum.

10. τῷ καλομυνῷ θώρακι] The epithet καλομυνῶ is inserted because the word θώραξ in this sense is a technical term of anatomy, the popular word being στέρνων οτ στήθος. It occurs nowhere else in Plato, but is common in Aristotle, who sometimes, as de partibus animalium IV xii 693 a 25, uses the same expression, τὰ τοῦ καλομυνὼν θώρακαν ἐπὶ τῶν τετραπόνων. Euripides has it once, Hercules furens I 995 ἐναντίον θώρακα καὶ βραχίων. Aristotle also uses the word in a more comprehensive sense than it bears nowadays, including the entire trunk: historia animalium i vii 491 b 29.

13. ὃν γυναικῶν, τήν ἀνδρῶν] This is no more than a mere simile: there is nothing in the words to warrant the titles which Martin bestows upon the two ἐδώ—l'âme mâle and l'âme féminelle; nor is there the slightest appropriateness in these names. It is not even said which division corresponds to the γυναικῶν, which to the ἀνδρῶν ὁχήμα.

44. διάφραγμα] This word, which has since become specially appropriated to the midriff, is used in a general sense by Plato for a fence or partition: Aristotle applies it to the cartilaginous wall dividing the nostrils, historia animalium i xi 492 b 16: the midriff he often calls διάφραγμα.

1 ἀνδρείας: ἀνδρίας AZ. 5 ἀμμα: ἀρχήν ἁμα S. 10 τῶν antie στενωπῶν omittunt AS.
13 ἐφ: ἐφή S. 15 οἰδήσια: οἴκησις A. 19 πόμα: πῶμα A pr. m. SZ.

3. κατήκουν] Undoubtedly this means 'within hearing of': that was the
object they had in view when they placed the ὄνομα ἑγγυτέρω τῆς κεφαλῆς.

4. ἐκ τῆς ἀκροπόλεως] Compare Galen de placitis Hippocratis et Platonis
11 230 καθάπερ ἐν ἀκροπόλει τῇ κεφαλῇ δίκην μεγάλου βασιλέως ὥ γεγέφαλος ὅρω-
tαι.

5. ἀμμα] This reading has best ms.
authority and gives the best sense: Stall-
baum's ἄρχην ἁμα is comparatively feeble.
It is true that Aristotle de inventite iii
468b 31 has ἃ δε καρδία ὅτι ἐστὶ πο ἄρχη τῶν
ψυχῶν: but that is no evidence that
Plato wrote ἄρχην here. Galen quotes
this passage, de plac. 11 292, and charges
Chrysippus with plagiarising the Platonic
dogma.

6. σφόδρος] From this word Galen
de plac. vi 573 infers that Plato makes
the heart the ἄρχη of the arterial circula-
tion only, not of the venous, the ἄρχη
of which is the liver; τὸ μὲν γάρ ἐξ
ήπατος ὁμομένων οὕτω περιφερεται σφοδρώς.
This seems however a slight basis on
which to found the inference that Plato
knew the difference between veins and
arteries, which he nowhere else gives any
sign of distinguishing: Compare pseudo-
Hippocrates de alimentis vol. ii p. 21
Kühn μίσως φιλεῖ βοράρ, μίσως ἀρτη-
ρίων κορδή, ἐκ τούτων ἀποπλανάται αἷμα
καὶ πνεῦμα, καὶ θερμαία διὰ τούτων
φοτα: the passage however has in it
unmistakable marks of a date long sub-
sequent to Plato's time or Aristotle's
either. The distinction between veins
and arteries seems also to have been
unknown to Aristotle; and unquestionably
he makes the heart the only ἄρχη.

9. τῶν ἐνδοθεων ἐπιθυμιῶν] Compare
the functions of the φίλακες in protecting
the city εἴτε τις ἐξωθεὶ ἢ καὶ τῶν ἐνδοθεων
soul which shares courage and anger, seeing that it is warlike, they planted nearer the head, between the midriff and the neck, that it might be within hearing of the reason and might join it in forcibly keeping down the tribe of lusts, when they would in no wise consent to obey the order and word of command from the citadel. And the heart, which is the knot of the veins and the fount of the blood which rushes vehemently through all the limbs, they made into the guardhouse, that whosoever the fury of anger boiled up at the message from the reason, that some unrighteous dealing is being wrought around them, either without, or, it may be, by the lusts within, swiftly through all the narrow channels all the sensitive power in the body might be aware of the admonitions and threats and be obedient to them and follow them altogether, and so permit the noblest part to be leader among them all.

For the throbbing of the heart in the anticipation of danger or the excitement of wrath, since they foreknew that all such swelling of passion should come to pass by means of fire, they devised a plan of relief, and framed within us the structure of the lungs, in which the first place is soft and void of blood, and next is perforated within with cavities like those of a sponge, in order that receiving the breath and the drink it might cause coolness and give rest and relief in the burning. Wherefore

\[\text{of the paramount importance of the lungs in the process of breathing and the purification of the blood: he is also of course quite wrong in calling them ὄσμας. His view is impugned by Aristotle on grounds of comparative anatomy, de partibus animalium }\]

17. \text{D. Diá πάντων τῶν στενωπῶν i.e. through all the narrow blood-vessels; to which, as we have seen, Plato attributed the functions which are really discharged by the nerves.}\n
11. \text{τῶν τε παρακελεύσεων καὶ ἀπελαλῶν] Cf. 71 B ἀλεπη προσενεχθείσα ἀπελήγ. τὸ βλέπτοντος of course = τὸ λογιστικόν.}\n
13. \text{τῇ δὲ δὴ πυθίσει] The violent beating of the heart under the influence of strong emotion is due to its hot and fiery composition. So the lungs, a soft and bloodless structure, were placed beside it, partly to cool it, partly to provide a soft cushion to receive its bounding. Plato, as we shall see when we come to his account of respiration, was unaware of the curious error Plato is at one with all, or nearly all, the best medical science of the day. Plutarch de Stoicorum repugnantis xxix says Πλάτων μὲν ἔχει τῶν ἱερῶν τοὺς ἐνδοξότατους μαρτυρουώτας, 17—2}
XXVII. To δὲ δὴ σίτων τε καὶ ποτῶν ἐπιθυμητικῶν τῆς ψυχῆς καὶ ἔσων ἐνυδείαν διὰ τὴν τοῦ σώματος ἱσχει φύσιν, τοῦτο εἰς τὰ μεταξὺ τῶν τε φρενῶν καὶ τοῦ προς τὸν ὀμφαλὸν ὅρον κατῴ-κισαν, οἷον φάτνην ἐν ἀπαντί τοῦτο τῷ τόπῳ τῆς τοῦ σώματος ὁ τροφὴ τεκτημένου καὶ κατέδησαν δὴ τὸ τοιοῦτον ἐνταῦθα ὡς θρέμμα ἄγριον, τρέφειν δὲ ἐνυμμένον ἀναγκαῖον, εἴπερ τι μέλλοι

2 ἁλμα μαλακῶν: μάλαγμα π. 11.

1 Ἰπποκράτην, Φιλιστίων, Διώξεπεν τον 'Ἰπποκράτειον, καὶ τῶν ποιητῶν Ἑὐρυπίδην, Ἀλκαίον, Εὐτύλων, Ἑραστιάθεντην, λέγοντας δὴ τὸ ποτῶν διὰ τὸ πνεύμονα διέξει. It is remarkable that Galen also held this view: cf. de plac. Hipp. et Plat. VIII 719 ἀλλὰ εἰ καὶ ζεῦον, διὰ τὴν ἐνθηλήσην, διοίκησαι πνεύματα, ὡς κεχρωσμένων ὕδωρ ὑπομεινήσαι πιεῖν, ἐν δόσῃ εἰς κανὼς χώραν, μεταχείρωσαι, εἰς αὐθέντως οὖσας ἀνατέμοιον, εὐφρενίες κεχρωσμένων τῶν πνεύμων. δήλον ὅτι ἐστὶν δὴ φέρεται τι τοῦ σώματος εἰς αὐτῶν. Galen's observation is, I believe, correct, though his inference is not so. Aristotle, on the contrary, was aware that no fluid passes down the windpipe to the lungs: see historia animalium I xvi 495b id ἥ μὲν οὖν ἄρτηρια τοῦτον ἐχει τὸν τρόπον, καὶ δέχεται μόνον τὸ πνεῦμα καὶ αὐθίνα, ἀλλὰ δ' ὀθέν οὔτε ἔρχεται ὅτι ἐρυσίν, ἡ πόσῳ παρέχει, ἐνώ ἐν εἰκόνι τὸ κατελθεῖν. See too de partibus animalium iii 664b, where he gives divers demonstrations that the hypothesis is untenable. It is also denied by the writer of book IV of the Hippokratean treatise de morbis, vol. II pp. 373; 374 Kühn: but affirmed by the author of de ossium natura, a work of uncertain date, vol. I p. 515 Kühn. Galen de plac. VII 715 points out that Plato conceives only a part of the fluid to pass down the trachea: οὐκ ἄνθρωπον οὐδὲ διὰ μέσης τῆς εὐ-

rυχωρίας τοῖς ὄργανοι φερομενοι, ἀλλὰ περὶ τῶν χίτωνα αὐτῶν ὑδροσειδῶς καταρρέειν. 1. τῆς ἄρτηριας] i.e. the windpipe: later it was designated ἡ πραξεῖα ἄρτηρια, whence trachea. This is the only usage of the word ἄρτηρια in Plato and Aristotle; it never means 'artery' in the modern sense. ὄστεον is plural like ἄρτηρια in 78 c, probably because of the bifurcation of the trachea into the bronchia before entering the lungs.

2. ἁλμα μαλακῶν] There is certainly no reason for altering the text: Plato might very well say 'a soft leap' for 'a soft place to leap upon'. Martin's ἄγμα is a very unhappy suggestion, and Hermann's μάλαγμα is as inappropriate as arbitrary. μάλαγμα means a poultice or fomentation; but the function of the lungs is distinctly stated just below, ὑπομεινήσαι εἰς ὑπείκον: this is perfectly well expressed by the received reading. I believe that Aristotle had this word ἁλμα in his mind, when he wrote ἁλμα in the passage from de partibus animalium quoted above. The object of the lungs then, according to Plato, is to quiet down the agitation of the heart and thereby render the emotional faculty capable of taking sides with the reason against the ενδυναμηκον.

4. μετὰ θυμόνι] i.e. that the heart, along with the emotional faculty seated therein, may be enabled to obey the
they made the windpipe for a channel to the lungs, which they set around the heart, as it were a soft cushion to spring upon; so that when wrath was at its height therein, the heart might leap upon a yielding substance and become cooled, and thus being less distressed it might together with the emotions be better enabled to obey the reason.

XXXII. But that part of the soul which lusts after meat and drink and all things whereof it has need owing to the body's nature, this they set between the midriff and the navel as its boundary, constructing in all this region as it were a manger for the sustenance of the body: and here they chained it like a wild beast, which must yet be reared in conjunction with the rest, if a mortal race were to be at all. To the end

reason: that is to say, that the emotional faculty may not be hampered in its action by the physical agitation of the organ which it employs. From first to last, in this dialogue as in the Republic, Plato regards the emotions, if they are given fair play, as sure allies of the reason.

70 D—71 D, c. xxxii. But that part of the soul whereunto belongs the craving for meat and drink the gods placed in the belly, where they made, as it were, its stall: and so they kept it far away from the habitation of the intellect, that it might cause the least disquietude. And since they knew that it could not apprehend reason, but would be led by dreams and visions of the night, they devised for it the liver, which should copy off for it all the messages from the brain; either terrifying it by threats and pains and sickness, or soothing it by visions of peace. Here then they set up the oracular shrine in the body of man: and since the appetitive soul could not directly comprehend the precepts of reason, they thought to guide it by signs and tokens and dreams which might be comprehended of it. A proof that divination is a boon for human folly is this. No sane man in his waking senses is a true seer: only that which is asleep or delirious or in some way beside himself has this gift. The part of the sane man is to interpret the prophetic utterances of the distraught seer, for that the prophet cannot do. Whence the seer always has an interpreter to expound his sayings; who often, but wrongly, is himself termed a seer. So then the liver is the seat of prophecy: but it has this virtue only during life: after death it is blind.

Next to the liver is placed the spleen, which is as a sponge to purify it and carry off noxious humour.

7. διὰ τὴν τοῦ σώματος [σχε Φύ-
σιν] This clearly teaches that it is for the sake of the body alone that the appetitive soul desires meat and drink; for itself it needs no such thing. The inference thence is that the ἐπιθυμητικὸν detached from the body is just pure soul, the one and only soul; but ἡ διὰ ἐπιθυ-
μητικὸν it is considered as working through and for the body, the nourishment of which it has to superintend.

9. οἶον φάτνην] This suggests a horse as the similitude, rather than a wild beast: compare Phaedrus 247 E.

10. ὃς θρέμα ἄγριον] Compare Rep-
public 588 c foll.

11. ἐπερ τι μέλλον] If a mortal crea-
ture is to be, it must have a body; the body must be animated and sustained by
τὸ θυητὸν ἔσεσθαι γένος. ἦν οὖν αἰει νημόμενον πρὸς φάτνη καὶ ὅ τι πορροτάτῳ τοῦ βουλευμένου κατοικοῦν, θόρυβον καὶ βοήν ὡς ἐλαχίστην παρέχον, τὸ κράτιστον καθ' ἴσως περὶ τοῦ πάσης κοινῆς ἐξουσίος ἕως βουλευόμεναι, διὰ ταῦτα ἐνταῦθ᾿ ἐδοξασεν ποὺς αὐτῷ τὴν τάξιν. εἰδότες δὲ αὐτῷ, ὡς λόγου μὲν οὔτε ἐξουσίεσσι ἐμελλέν, εἰ τὲ τῆ καὶ μεταλαμβάνου τινὸς αὐτῶν ἀισθήσεως, οὔκ ἐμφυνότα τοῦ μέλειν τινῶν ἐσοίτο λόγων, ὕπὸ δὲ εἰδώλων καὶ φαντασμάτων νυκτὸς τε καὶ μεθ’ ἡμέραν μάλαστα πνευματικόν, τούτῳ δὴ θεός ἐπιβουλεύσας αὐτῷ τὴν ἔκτασιν ἑδαιμόνες ἐνε-πος καὶ ἐθήκεν εἰς τὴν ἐκείνου κατοίκησιν, πυκνῶν καὶ λεων Β καὶ λαμπρῶν καὶ γλυκῶν καὶ πικρῶτα ἐχον μηχανσμάτως, ἵνα ἐν αὐτῷ τῶν διανοημάτων ἡ ἐκ τοῦ νοῦ φερομένη δύναμις, οἴον ἐν

1 τὸ θυητὸν: ποτὲ θυητὸν S. 6 αὐτῶν αἰσθήσεως: αἱ τῶν αἰσθήσεως SZ.

soul; hence there must be an ἐπιθυμητικός, or, as Aristotle would say, a θερητικὸς εἴδος of soul. For, as has been said, the differentiation of souls into individuals involves materialisation and hence imperfection.

5. οὐτε ἐξουσίεσιν ἐμελλέν] The lowest εἴδος would not have any comprehension of rational principles, or if haply it had some inkling of them, it would not care to pay any heed to them. Therefore they are expressed to this faculty in similitudes by means of the liver. It will be noticed that this symbolic representation of the dictates of the individual reason is exactly analogous to the symbolic manifestation of the ideas of universal reason by means of the sensible perception of particular objects.

6. αὐτῶν] This is doubtless right, referring to the πινῶν λόγων which follows. Stallbaum’s reading is, as I think, weak in sense.

8. καὶ μεθ’ ἡμέραν] The phantasms of the daytime are the perceptions of the senses.

10. τὴν ἐκείνου κατοίκησιν] sc. τῆς τοῦ ἐπιθυμητικοῦ. In his account of the relations of the liver with the ἐπιθυμητικὸν Plato has by anticipation refined beyond the point made by Aristotle in nic. eth. I xiii 1103b 23 foll. ἵνα δ᾽ οὖν ἐν

ητὸν καὶ ἐν τῇ ψυχῇ νομιστέον εἶναι τι παρὰ τὸν λόγον, ἐναρτιομένου τούτῳ καὶ ἀντιβαίνον. πῶς δ᾽ ἔτερον, οὐδὲν διαφέρει. λόγον δὲ καὶ τούτῳ φαίνεται μετέχειν, ὥσ-περ εἴπομεν πειθαρχεῖ γὰρ τῷ λόγῳ τοῦ τούτου ἐγκρατοῦ. ἐτι δ᾽ ἐςως εὐκοστότερον ἐστι τὸ τῶν σώφρων καὶ ἀνθρεῖον πάντα γὰρ ὁμοφωσί τῷ λόγῳ. φαίνεται δὴ καὶ τὸ λόγων διετέον. τὸ μὲν γὰρ φυτικὸν οὐδέμως κοινωνεῖ λόγον, τὸ δὲ ἐπιθυμητικόν καὶ διὸς δρεκτικὸν μετέχει πως, ἣ κατη-κόντεν ἐστιν αὐτῷ καὶ πειθαρχικόν. οὕτω δὴ τοῦ πατρὸς καὶ τῶν φίλων φαιμεῖ ἔχειν λόγον, καὶ οὐχ ὅπερ τῶν μαθηματικῶν. δτι δὲ πειθαρχεῖ πως ὑπὸ τοῦ λόγου τὸ ἀλ-γον, μηνέει καὶ ἡ νουθετίσας καὶ πάσα εἰπε-τιμᾶσας καὶ παράκλησας. εἰ δὲ χρη καὶ τοῦτο φάσαι λόγον ἔχειν, διττὸν ἐστὶ καὶ τὸ λόγῳ ἔχον, τὸ μὲν κυρίω καὶ ἐν αὐτῶ, τὸ δὲ ὅσπερ τοῦ πατρὸς ἀκούστικὸν τι. In Aristotle’s analysis then the rational part is twofold, the one kind possessing reason absolutely, the other listening to its behests. The λόγον also is twofold, one kind being absolutely irrational, while the other metέχει πη λόγου. It thus appears that the lower kind of λόγου ἔχον is identical with the higher kind of ἀλ-γον: that in fact they are the same thing viewed in different aspects. Comparing this with Plato’s statement, we shall find that Aristotle’s ἀλγον μετέχου πη λόγου
then that always feeding at its stall and dwelling as far as possible from the seat of counsel, it might produce the least possible tumult and uproar and allow the noblest part to consult in peace for the common weal, here they assigned it its place. And knowing that it would have no comprehension of reason, and that even if it did in some way gain any perception of rational thoughts, it was not in its nature to take heed to any such things, but that it would be entirely led away by images and shadows both by night and by day, God devised as a remedy for this the nature of the liver, which he constructed and set in its dwelling place: and he made it a body dense and smooth and bright and sweet with a share of bitterness. This he did to the end that the influence of thoughts proceeding

occupies the same position as Plato’s θυμοεδῆς καθήκον τοῦ λόγου. This directly hears and obeys the dictates of reason. If a man is betrayed by his friend, the declaration by the reason that such conduct is immoral is at once responded to by the θυμοεδῆς with a surge of indignation against the friend’s baseness. But no such response would come from the ἐπιθυμητικῶν, which is incapable of understanding the situation. The judgments of the reason must therefore be conveyed to it in the symbolic form which alone appeals to it, by signs and visions, by portents and presages and terrors. This indirect communication has no place in the statement of Aristotle, who would no doubt denounce it as πλασματώδες. It must of course not be forgotten that Aristotle’s ἐπιθυμητικῶν is not the same as Plato’s.

A point worth noticing is a certain advance in the psychology of the Timaeus as compared with that of the Phaedrus. In the latter the lowest εἰδῶs is simply appetitive; but in the Timaeus it includes the functions of nutrition and growth. This is plain from 70 ε ὀλὸν φάτνην κ.τ.λ.; and also from the fact that the τρίτον εἰδῶs is assigned to plants. Aristotle then is in reality indebted to Plato for his θρεπτικῶν καὶ φυτικῶν: though it must be confessed that the debt is by no means acknowledged.

11. [ἐν ἀντὶ] As this long sentence is very involved, a few words about the construction may not be amiss. The optatives belonging to ἔνα are φοβοῖ (the temporal clause after ὁπότε extending as far as παρέχει) and the second ποιεῖ: while to ὁπότε belong ἐμφαίνω, the first ποιεῖ, and παρέχει; and to δὲ belongs ἀποσώφρασθοι only. The μὲν after φοβοῖ ought to have been answered by a δὲ, when the soothing influence was first mentioned, but the length and intricacy of the sentence has interrupted the exact correspondence, so that the second member is introduced by καὶ instead of δὲ. Again, it is not at first sight obvious, especially as the sentence is sometimes punctuated, to see where the apodosis to δὲ ἀντὶ begins. I should without hesitation, putting a comma after ἀπευθύνονσα, make the beginning of the apodosis at ὅλων τε: though, if we took the participles παρέχονσα and the rest in agreement with δίναμι instead of ἔπιθυμον, it would be possible to begin the apodosis at τῆς μὲν πικρότητος. But the former view seems to me in every way preferable. ἐν ἀντὶ is anticipative of the clause beginning ὁλὸν ἐν κατόπτρῳ, from which we must supply the notion ‘producing reflections in it’.
2. μέρει τῆς πυκρόντος χρωμένης [ευγγενείς] Stallbaum understands τῶν ἠπατί after ευγγενείς, saying ‘ridicule enim quidam sic interpretantur, ac si rationis naturae cognatum intelligatur’. It appears to me that the ‘ridiculous’ interpretation is the only correct one: ευγγενείς signifies, akin to the dark and gloomy nature of the thoughts which are conveyed by ἡ ἐκ τοῦ νοῦ φερομένη δύναμις: see below μήτε προσάπτεσθαι τῆς ἐναντίας ἑαυτῆς φύσεως εἴδελθι. If the bitterness belonging to the liver is of a contrary nature to cheerful thoughts, it can hardly be very ridiculous to conceive that it is of kindred nature to thoughts that are gloomy. So Wagner, ‘was seiner Natur (d. i. des Nachdenkens) entgegen-gesetzt ist’.

3. ἀπειλῇ] Hermann punctuates so as to join this word with κατὰ πᾶν ὑπομεγνύσα κ.τ.λ., which surely gives it an intolerable situation. Cf. 70 b.

5. λοβὸν δὲ καὶ δοχᾶς πῦλας τε] The λοβὸν here meant is the lobe κατ’ ἐξοχήν, the large right lobe of the liver, in which the gall-bladder is situated; to which effect Stallbaum cites Rufus Ephesius: the δοχαῖ seem to be the small vessels in the liver: the πῦλαι are the two entrances of the portal vein, which conveys blood to the liver; the plural is used because the vein divides into two branches immediately before entering the liver. That all these were of high importance in sacrificial divination is clear from Euripides Electra 827—829:

καὶ λοβὸς μὲν οὖ προσὴν σπλάγχνοις, πῦλαι δὲ καὶ δοχαὶ χολῆς πέλας κακᾶς ἐφανον τῷ σκοποῦσι προσβολᾶσ.

Compare Aristotle historia animalium 1 xvii 496b 29 προσπέφυκε δὲ τῇ μεγάλῃ φλεβῇ τῷ ἤπατο, τῇ δ’ ἀρτήρῃ οὖ κοινωνίᾳ διὰ γὰρ τοῦ ἦπατος διέχει ἡ ἀπὸ τῆς μεγάλης φλεβὸς φλέβη, ἡ δ’ αἱ καλομέναι πῦλαι εἰς τοῦ ἦπατος. The μεγάλη φλέβη is evidently the vena cava; see de partibus animalium 111 iv 666b 24 οὗτι δὲ πρῶτον ἐν τῇ καρδίᾳ γίνεται τὸ αἷμα πολλάκις ἐρήκαμεν, διὰ τὸ τὰς ἀρχηγοῖς φλέβας ὑπὸ εἴσαι, τὴν τε μεγάλην καλομένην καὶ τὴν ἀρτήριν; while ἡ ἀπὸ τῆς μεγάλης is as clearly the portal vein.
from the brain, when the liver received outlines of them, as if in a mirror, and exhibited reflections to view, might strike terror into the appetitive part, whenever making use of the bitter element akin to its own dark nature and threatening with stern approach, diffusing the bitterness swiftly throughout the whole liver it displayed a bilious colour, and contracting it made it all rough and wrinkled, and reaching the lobe and the vessels and the inlet, twisted the first from its right position and contorted it, while at the same time it obstructed and closed up the two latter, thereby producing pain and nausea: and on the other hand in order that, whenever a breath of mildness from the reason copied off on the liver visions of an opposite kind, giving relief from the bitterness, because it will not excite a nature opposite to its own nor have dealing with it, but using upon the liver the sweetness that exists therein and soothing everything till all is straight and smooth and free, it might render gentle and calm that part of the soul which is settled about the liver, and might enable it to secure a sober amusement at night, enjoying divination during sleep, in recompense for its deprivation of intelligence and wisdom. For our creators, because they remembered the behest of their father, when he commanded them to make the mortal race as perfect as they

τά μὲν] I suspect τόν μὲν to be the right reading.

6. Λύτας καὶ ἀσάς] The effect is partly physical, partly moral: the pains and nausea would cause evil dreams, which served as portents and deterrents. Hermann, presumably by a typographical error, puts no stop at all after παρέχω.

8. πραότητος τις...ἐπίννοια] With this very striking expression compare the beautiful phrase in Aeschylus Agamemnon 740 φρόνημα νηνέου γαλάως. ἐπίννοια is the regular word for divine inspiration: cf. Phaedrus 265 B, Laws 811 C.

10. γλυκύτητι τῇ κατ’ ἐκάνο] sc. τὸ ἔπαρ: the ἐπίννοια uses upon the liver (πῶς αὖτο) the sweetness which permeates it. ἥμφατω, i.e. akin to the ἐπίννοια. Stallbaum understands πῶς αὖτο to refer to the ἐπίθυμητικον: but this will not do. For αὖτο must surely have the same reference as αὖτοι, which necessarily means τοῦ ἡπατος.

12. Ἰεὼν τε καὶ εὐήμερον ποιοῖ] Aristotle (who must have been rather mystified by this passage) has a direct reference to these words in de partibus animalium iv ii 676 b 22 διὸ καὶ λέγουσι τὴν φύσιν τῆς χολῆς ἀσθενείας τινος εἶναι χάριν ὁ θεὸς ἡγεῖται λέγουσιν. φασὶ γὰρ εἶναι διὰ τοῦτο, ὅπως τῆς ψυχῆς τὸ πεῖρι τὸ ἦπαρ μόριον δάκνουσα μὲν συνιήτη, λυβέμενον δ’ Ἰεὼν ποιῇ. Aristotle is himself decidedly sceptical concerning the prophetic character of dreams: see his exceedingly interesting treatise de divinatione.

13. ἤν τε τῇ ποικί] The τε merely couples ἔχουσαν with Ἰεὼν τε καὶ εὐήμερον,
3. ἀφροσύνη θεὸς ἀνθρωπίνη δεδωκεν] The keen irony pervading the whole of this very curious and interesting passage is too evident to escape notice. Plato had no high opinion of μαντική and μάντεις: the μαντικός bios comes low in order of merit in Phaedrus 248 E. See too the contemptuous reference to ἄγρατα καὶ μάντεις in Republic 364 B, and Symposium 203 A καὶ τὴν μαντείαν πάσαν καὶ γοητειῶν. In Politicus 290 D he says with similar irony τὸ γὰρ δὴ τῶν ἱερῶν σχῆμα καὶ τὸ τῶν μαντῶν εὐδηλοὶ φρονήματα πληροῦται καὶ δόξαν σεβαίνει λαμβάνει διὰ τὸ μέγεθος τῶν ἑγχειρημάτων: but for all their assumption, they practise but a 'servile art', ἐπιστήμης διακόνων μόρων.

οὐδεὶς γὰρ ἐννοεῖ] Compare Phaedrus 244 A ἢ τε γὰρ δὴ ἐν Δελφοῖς προφήτεις αὖ τε ἐν Δωδεκάνυμι λέγεισα μεν πολλὰ δὴ καὶ καλὰ ἱδίᾳ ταῦτα ἐγράφασα, σωφρονοῦσα δὲ βραχέα ἡ οὐδέν. Presently follows the well-known derivation of μαντική from μαντικῆ. The most remarkable passage is at 244 B: ἀλλὰ μὴν νόσος γε καὶ πῦρ τῶν μεγαλῶν, δὴ δὲ παλαιόν ἐκ μηνιάτων πόθεν ἐν τοῖς τῶν γενέων, ἡ μαντία ἐγγενεμένη καὶ προφητεύσασα οἰς ἔδει, ἀπαλλαγὴν εὑρέτο, καταφέργοια πρὸς τὰς εἰς τὰς καταρτεῖς, δὴν δὴ καθαρμῶν ταῦτα καὶ τελετῶν τυχοῦσα ἐξάντλε ἐπίσκοπος τῶν εὐαγγελίστων πρός τοῖς παρόντα καὶ τοῖς ἐπείτω κρένων, λύσιν τῷ ὀρθῶς μανεῖν καὶ κατακαθισμένων τῶν παρόντων κακῶν εὐρομένη: where see Thompson's note.

6. παραλλάξασ] For this sense of the word see above, 27 C ἢ μὴ παντάπασι παραλλάττομεν, and Euripides Hērylyτιτ 935 λόγοι παραλλασσόμεν ἐξεδόθοι φρενών. 7. ἀναμνησθέντα] sc. ὑπὸ τοῦ ἐμφρονοῦν το τῶν προφητῶν γίνοις] The
were able, in this wise redeeming even the baser part of us, that it might have in some way a hold on the truth, placed in this region the seat of divination.

Now that divination is the gift of God to human folly, this is a sufficient proof. No man in his sound senses deals in true and inspired divination, but when the power of his understanding is fettered in sleep or by sickness, or if he has become distraught by some divine possession. The part of the sane man is to remember and interpret all things that are declared, dreaming or waking, by the prophetic and inspired nature; and whatsoever visions are beheld by the seer, to determine by reason in what way and to whom they betoken good or ill in the future or the present or the past: but it is not for him who has become mad and still is in that state to judge his own visions and utterances; the old saying remains true, that only for the sane man is it meet to act and to be the judge of his own actions and of himself. Whence has arisen the custom of setting up interpreters as judges of inspired prophecy: these are themselves called prophets by some who are altogether unaware that they are but the expounders of mystic speech and visions, and ought not in strict accuracy to be called prophets, but interpreters of the prophecies.

Such is the nature of the liver and its situation that we have described, for the purpose of prophecy as aforesaid. And while each body has life, this organ displays the signs clearly

function of the προφήται is well illustrated by Euripides Ion 413—416:
ΞΩΤ. ἔσται τὰς ἄλλα τὰς προφητεύεις θεοῦ;
ΙΩΝ. ἡμεῖς τὰ γ' εἴω, τῶν οὓς ὅ' ἄλλοις
κέλει
οἱ πλησίων βάσσουσι τρίποδος, ὃ
ἐπε,
Δελφῶν ἀριστῆς οὗ ἐκλήρωσεν
πάλοις.
This points to the existence at Delphi of two classes of προφήται: one class, to which only high-born Delphians were admitted, heard the inspired utterances of the Pythia herself; the other and less exclusive class having to declare whatever was to be made known to the public without.

16. οὗ τι μάντες προφήται διή It must be confessed that Plato is himself guilty of a converse error, when in Phaedrus 244 B he applies the term προφήτης to the Pythian priestess. This however is venial; for the Pythia may be regarded as the προφήτης of Apollo, whereas her προφήται are in no sense μάντες.

18. χαίρειν μαντικής] Plato does not altogether ignore the physiological functions of the liver, as may be seen from the important part played by χαίρειν, when this secretion is in a morbid condition, in his pathology. But he characteristically gives chief prominence to the final cause, which is to redeem the ἐπιθυμητικῶν from complete irrationality.
γέστερα ἔχει, στερηθέν δὲ τοῦ ἔτη γέγονε τυφλὸν καὶ τὰ μαντεία ἀμυδρότερα ἐσχὶ τοῦ τι σαφὲς σημαίνει. ἡ δ’ αὖ τοῦ γελτονος οὐ αὐτῶ ξύστασι καὶ ἐδρα σπλάγχνου γέγονεν εὖ ἀριστερὰς χάριν ἐκείνου, τοῦ παρέχειν αὐτὸ λαμπρὸν αἰε καὶ καθαρὸν, ὁλον κατόπ-5 τρο παρεσκευασμένον καὶ ἐτοιμον αἰε παρακείμενον ἐκμαγεῖον· διὸ δὴ καὶ ὅταν τινὲς ἀκαθαρσίαι γίγνονται διὰ νόσους σώματος περὶ τὸ ἵππαρ, πάντα ἡ σπλήνος καθαλοῦσα αὐτὰ δέχεται μαύτης, ὅτε κοῖλο καὶ ἀναίμου ὑφανθέντος ὅθεν πληροῦμενοι τῶν ἀποκαθαιρομένων μέγας καὶ ὑπούλως αὐξάνεται, καὶ πάλιν, ὅταν διὸ καθαρῆ τὸ σῶμα, ταπεινοῦμενος εἰς ταῦτον ἔμνιζε.

XXXIII. Τὰ μὲν οὖν περὶ ψυχῆς, ὅσον θητὸν ἔχει καὶ ὅσον θεῖον, καὶ ὅπη, καὶ μεθ’ ὅν, καὶ δὲ ἡ χαρις φάκισθη, τὸ μὲν ἀληθὲς ὡς εἴρηται, θεοῦ ἔμμυφησαντος, τὸτ’ ἰ’ ὅστ’ ὅστ’ αὐτὸς διασχυρίζομεθα, τὸ γε μὴν εἰκὸς ἦμιν εἰρήσθαι καὶ νῦν καὶ ἐτι μάλλον ἀνασκοποῦσιν 15 διακινδυνεύτεον τὸ φάναι, καὶ πεφάσω. τὸ δ’ ἔξης δὴ τούτοις Ε

1. στερηθέν δὲ τοῦ ἔτη] The function of the liver in divination is twofold, one mode being proper to man, the other to beasts. In the living man it is the means of warning him by dreams and visions; while the liver of the slaughtered beast gives omens of the future by its appearance when inspected. The efficacy in the first case Plato satirically allows, as a sop to human folly; to the second he will not allow even this.

5. ἐκμαγεῖον] Here we have a totally different use of the word from that in 50 c: it now means a sponge or napkin for wiping clean. The spleen then, according to Plato, exists solely for the sake of the liver, to purge it of superfluous and noxious humours, which it receives into itself and disposes of.

72 D—76 E. c. xxxiiii. Now to assert that all we have said in the foregoing is certainly true were folly, wanting the assurance of some god, yet the account that seemed to us most likely, this we have given. On the same plan we have next to describe the remaining parts of the human body. First the intestines were devised as a precaution against gluttony and excess, in order that the food might not by passing through too rapidly leave a void that needed perpetual replenishment. Of bones and flesh the foundation is the marrow. This is made of the very finest and most perfect elements of fire air water and earth commingled. Part of this was moulded into a globe-like form and placed in the head; the rest, drawn out into a cylindrical shape, in the spinal column. And the marrow of the head, which we call the brain, is the habitation of the reason; while the lower forms of soul were attached to the spinal marrow. Bone is formed of fine earth kneaded with marrow and then tempered by being plunged alternately into fire and water; and of this was made a hard envelope to protect the vital marrow: and joints were inserted in the limbs for the sake of flexibility. And to prevent the structure of the bone decaying, the gods constructed flesh, and to impart the power of moving the limbs at will they made tendons. Flesh is a kind of ferment made with fire and water and earth, containing an acid and saline admixture; tendons, which are of a tougher and finer consistency, are made of unfermented flesh mingled with
enough; but when deprived of life, it is become blind and gives the token too dimly to afford any plain meaning. And the structure of the neighbouring organ and its position on the left has been planned for the sake of the liver, in order to keep it always bright and clean, as a napkin is prepared and laid ready for the cleansing of a mirror. Wherefore whenever any impurities arise in the region of the liver owing to sickness of the body, all is received and purified by the fine substance of the spleen, which is woven hollow and void of blood. This, when it is filled with the impurities from the liver, waxes swollen and festered; and again, when the body is purged, it is reduced and sinks again to its natural state.

XXXIII. Now as concerning soul, how far she has a mortal, how far a divine nature, and in what wise and with what conjunctions and for what causes she has her separate habitations, only when God has confirmed our statement can we confidently aver that it is true: nevertheless that we have given the probable account we may venture to say even now and still more on further meditation, and so let it be said. But what follows

bone. And such of the bones as contained the greatest amount of vital marrow the gods covered with the thinnest envelope of flesh; such as contained less, with a thicker envelope; to the end that the marrow in the former might not have its sensitiveness blunted by a thick covering. For this cause the head has but a slight covering, though a thicker one would have better protected it; since the gods deemed that a shorter and more intelligent life was preferable to a longer and less rational. In the construction of the mouth and neighbouring parts both the necessary cause and the divine cause were consulted: the necessary in view of the nutriment that must enter in, the divine in view of the speech that should issue forth. For the further protection of the head they devised the following. The surface of the flesh in drying formed a tough rind, which we call the skin: this is pierced by the internal fire of the head, and the moisture issuing through the punctures forms what we call hair. And the nails are formed by the skin at the end of the fingers, mixed with tendon and bone, being suddenly dried: for the gods knew that other creatures would arise out of mankind in future ages, which would need these defences.

14. τὸ γε μὴν εἰκός] It may be objected that soul is immaterial and eternal, and therefore we must not be satisfied with τὸ εἰκός concerning her. But here we are treating not of the nature of soul as she is in herself, but of her connexion with body: this belongs to the region of physics and consequently to that of the 'probable account'. Therefore Plato begins the chapter with a reiterated warning that we are dealing with matters where absolute certainty is impossible. But this does not apply to the exposition concerning the soul's own nature which we had in 34 b—37 c.
κατὰ ταύτα μεταδιωκτέων. ἦν δὲ τὸ τοῦ σώματος ἐπίλουπον ἡ γέγονεν. ἐκ δὴ λογισμοῦ τοιούτῳ ξυνίστασθαι μάλιστ' ἂν αὐτῷ πάντων πρέποι. τὴν ἐσωμήν ἐν ἑμὶ ποτῶν καὶ ἐδεστῶν ἀκολασίαν ἤσεαν οἱ ξυνισθέντες ἡμῶν τὸ γένος, καὶ ὁ τοῦ μετέρου καὶ ἀνάγω καίου διὰ μαργάνητα πολλῆς χρησοῦμεθα πλέον. ἦν οὖν μὴ φθορὰ διὰ νόσους δεξία γύρωι τοῖς ἀτέλεσι τὸ γένος εὐθὺς τὸ θυτὸν τελευτῶ, ταῦτα προσφέρομεν τῇ τοῦ περιγεννησμένου πόματος ἐδέ. 73 Α σματὸς τε ἔξει τὴν ἀνωμαξάμενην κάτω κοιλίαν ὑποδοχὴν ἔθεσαν, εἰλιξίναν τέ πέριξ τῶν τῶν ἐντέρων γένεσιν, ὅπως μὴ ταχὺ διεκπετὸ ῥόσα ἡ τροφή ταχὺ πάλιν τροφῆς ἐτέρας δεῖσθαι τὸ σῶμα ἀναγκάζοι, καὶ παρέχουσα ἀπληστίαν διὰ γαστρομαργίαν ἀφιλόσοφον καὶ ἀμουσου πᾶν ἀποτελοῦ τὸ γένος, ἀνυπήκοιον τοῖς θεοτάτοις τῶν παρ' ἡμῖν. τὸ δὲ ὅστιν καὶ σαρκῶν καὶ τῆς τοιαύτης φύσεως πέρι πάσης ὁδε ἐσχῇ. τούτως ὕμπαυσαν ἀρχῇ μὲν ἡ τοῦ μυελοῦ ὑγείας. οἱ γὰρ τοῦ βλου δεσμοὶ τῆς ψυχῆς τῷ σώματι ξυνδομένης ἐν τούτῳ διαδούμενοι κατερρίζουσιν τὸ θυτὸν γένος. αὐτὸς δὲ ὁ μυελὸς γέγονεν εἴς ἄλλους. τῶν γὰρ τριγώνων ὅσα πρῶτα ἄστραβη καὶ λεία ὄντα τῷ περὶ τε καὶ ὑδωρ καὶ ἀέρα καὶ γῆν δὲ ἀκριβείας μάλιστα ἦν παρασειχν ὑπονομηθα, ταῦτα ὁ θεὸς ἀπὸ τῶν ἐαυτῶν ἐκκαστα γενῶν χωρίς ἀποκρίνον, μνημὸς δὲ ἄλληλος ξύμμετα, Ο

6 τελευτῆς: τελευτῆς Σ.

7 πόματος: πώματος ΑΣΖ.

1. ἦν δὲ] Referring back to 61 εις σαρκὸς δὲ καὶ τῶν περι σάρκα γέγονεν, ψυχῆς τε δόσον θυτὸν, ὡστε διεληλύθαμεν.

8. τὴν ἀνωμαξαμένην] ‘So-called’, because ἡ κάτω κοιλία was a medical term: see Hippokrates passim: it denoted all the region of the body below the ὤφρας strictly so called: cf. Aristotle problemata ἅκελον ΧΧΙΙΙΙ ἵνα 962 θυτῶν δυντών, κεφαλῆς καὶ ὦφρας καὶ τῆς κάτω κοιλίας, ἡ κεφαλὴ θειάτρων. The ὦφρας, though sometimes applied to the entire cavity of the body, was properly identical with ἡ ἄνω κοιλία, which included the stomach: cf. de partibus animalium 111 λί 674 θ 29.

9. ὑποδοχήν] Plato does not seem to have understood very clearly the functions of this part of the human anatomy, merely regarding it as a safeguard against gluttony. Aristotle has a preciser conception: see de partibus animalium 111 λί 674 θ 12 folla.

9. ταχὺ διεκπετῶσα] We should thus relapse into the life symbolised by the ἀγγεία τετρμένα καὶ σάρπα in Gorgias 493 Ε: cf. 494 Β χαραδρομίῳ τῷ αὐτοῦ βλου λέγεις.

15. οἱ γὰρ τοῦ βλου δεσμοὶ] That is to say, it is through the marrow that the soul is linked to the body. Plato, though unacquainted with the nervous system, saw clearly that the spinal marrow and ultimately the brain was the centre of consciousness: a point wherein he is much ahead of Aristotle, who declared (1) that the brain and spinal marrow are essentially different substances, (2) that the function of the brain is merely to cool the region of the heart: see de partibus
upon the foregoing is the next object of our research: this was the manner wherein the rest of the body has come into being.

The following is the design on which it were most fitting to conceive that it is constructed. They who framed our race knew the intemperance in meat and drink that would prevail in us, and that for greed we should use far more than was moderate or necessary. In order then that swift destruction through sickness might not fall upon us, and that the mortal race might not perish out of hand before coming to completion, foreseeing the danger they made the abdomen, as it is called, a receptacle to contain the superfluous of food and drink, and coiled the bowels round about therein, lest the food passing speedily through should compel the body quickly to stand in need of a fresh supply, and thus producing an insatiable craving should render the whole race through gluttony devoid of philosophy and letters and disobedient to the highest part of our nature.

Concerning the bones and flesh and all such substances the case stands thus. The foundation of all these is the marrow: for the bonds of life whereby the soul is bound to the body were fastened in it throughout and planted therein the roots of human nature. But the marrow itself comes from other sources. Such of the primal triangles as were unwarped and smooth and thus able to produce fire and water and air and earth of the purest quality, these God selected and set apart, each from its own class, and mingling them in proportion one

animalium II vii 652a 24 πολλοῖς γὰρ καὶ ὁ ἐγκέφαλος δοκεῖ μυελὸς εἶναι καὶ ἀρχὴ τοῦ μυελοῦ διὰ τὸ συνεχῆ τὸν ραχίτην αὐτῷ ὑπὸ τὴν μυελῶν. ἦστι δὲ πάν τοῦπαντιοὶ αὐτῷ τὴν φύσιν, ὥς εἰπεῖν, ὅ μὲν γὰρ ἐγκέφαλος ψυχρότατον τῶν ἐν τῷ σώματι μαρίλων, ὁ δὲ μυελὸς θερμός τὴν φύσιν. 652β 16 ἐπεί δ' ἀπαντά δεῖται τῆς ἐναντίας ῥοπῆς, ὦν τυγχάνει τοῦ μετρίου καὶ τοῦ μέσου, ἀλλ' ἀπαντά τὴν αἰτίαν πρὸς τὸν τῆς καρδίας τότον καὶ τὴν ἐν αὐτῇ θερ-μοτήτα μεμηχανεῖται τῶν ἐγκέφαλον ἡ φύσις, καὶ τοῦτον χάριν ὑπάρχει τούτο τὸ μέρος τοῖς ἔξω, τὴν φύσιν ἔχουν κοινὴν ὑδατος καὶ γῆς. Plato had considerably less knowledge of anatomy than Aristotle; but this is one of several cases where his superior scientific insight keeps him nearer to the truth.

16. ἐν τούτῳ] i.e. in the spinal marrow; for the brain was the seat of the θείων γένοι.

17. ἐξ ᾠλῶν] sc. ἡ ὀστῶν καὶ σαρκῶν καὶ τῶν τοιούτων.

τῶν χαρ τριγώνων] The triangles being the elements of the corpuscles of which matter is composed, Plato speaks of them as the elements of μυελῶς.
πανοπερμίαν παντὶ θυτόν γένει μηχανώμενος, τῶν μυελῶν εἰς αὐτῶν ἀπειργάσατο, καὶ μετὰ ταύτα δὴ φυτεύων ἐν αὐτῷ κατέδει τὰ τῶν ψυχῶν γένη, σχημάτων τε ὡσα ἐμελλένιν αὐδὶ σχῆσειν οἷᾳ τε καθ' ἐκαστα ἔδοχον τὸν μυελὸν αὐτῶν τοσαῦτα καὶ τοιαῦτα διηρεῖτο σχῆ-5 ματα εὐθὺς ἐν τῇ διανομῇ τῇ κατ' ἀρχάς. καὶ τὴν μὲν τὸ θεῖον σπέρμα οἷον ἁρώμων μέλλουσαν ἐξεῖν ἐν αὐτῇ περιφερῇ πανταχῇ πλίσας ἐπωνόμασε τοῦ μυελοῦ ταύτην τὴν μοῖραν ἐγκέφαλον, Δ ὁς ἀποτελεσθέντος ἐκάστου ζῴου το περὶ τούτῳ ἀγγείῳ κεφαλῆς γεννησόμενον. ο ̣ ὡς αὐ τὸ λοιπὸν καὶ θυτόν τῆς ψυχῆς ἐμελλε 1ο καθέξειν, ἀμα στρογγύλα καὶ προμήκη διηρεῖτο σχῆμα, μυελοῦ δὲ πάντα ἐπεφήμισε, καὶ καθάπερ ἐξ ἀγκυρῶν βαλλόμενος ἐκ τούτων πάσης ψυχῆς δειμμοῦ περὶ τούτῳ ξύμπαν ήδη τὸ σῶμα ἡμῶν ἀπειργάσετο. στέγασμα μὲν αὐτὸ πρῶτον εὐμπηγνύν περίβολον οστέων. τὸ δὲ οὐστοῖν ξυνίστησιν ὥς ἡμεῖς καθαράν Ε 15 καὶ λειαν ἐφύρασε καὶ ἐδέσωσε μυελὸν, καὶ μετὰ τούτο εἰς πῦρ αὐτὸ ἐντίθησιν, μετ' ἐκείνου δὲ εἰς ὕδωρ βάπτετε, πῦλον δὲ εἰς πῦρ αἰθίς τε εἰς ὕδωρ μεταφέρον δ' οὕτω πολλάκις εἰς ἐκάτερον ὑπ' ἀμφοῖν ἄτκτον ἀπειργάσαστο. καταχρόμενος δὴ τὸ τούτῳ περὶ μὲν τὸν ἐγκέφαλον αὐτοῦ σφαῖραν περιτορέννειν οστεῖν, ταύτη δὲ στε- 20 νὴν διέξοδον κατελείπετο καὶ περὶ τῶν διανυχεῖν ἀμα καὶ νω- 74 Λ τιαίον μυελὸν εἰς αὐτοῦ σφοινδύλους πλάσας ὑπέεινεν οἷον στρό- φυγας, ἀρξάμενος ἀπὸ τῆς κεφαλῆς, διὰ παντὸς τοῦ κύτους. καὶ τὸ πᾶν δὴ σπέρμα διασφόξαν οὕτω λιθοειδεῖ περιβόλῳ εὐνέφραζεν.

13 περίβολον: sic H e Valckenari conlectura. περὶ δὲν ASZ et codices omnes.
20 κατελείπετο: κατελείπετο SZ.
23 οὕτω: οὕτως Λ.

1. πανοπερμίαν] The marrow, being formed from all the four elements, was capable of supplying material for all parts of the human frame.
3. ὡσα ἐμελλε] It is remarkable that, although Plato only mentions two σχήματα explicitly, his phraseology is so studiously vague concerning their number as to lead one to imagine that he may have suspected the existence of further ramifications of μυελός, such as in fact are the nerves.
καθ' ἐκαστα ἔδοχ] sc. τῇ ψυχή: the shape of the different portions of marrow in the body was made to suit the nature of that particular function of soul which acted through it. There are however no special divisions of μυελός for the θυμοειδὲς and the ἐπιθυμητικόν separately; the spinal cord serving for the θυτόν as a whole.
5. τῇ κατ' ἀρχάς] i.e. without waiting for the differentiation to be made in the course of evolution.
6. περιφερῇ] The brain is made approximately spherical, because, as we have seen, the action of reason is symbolised by the rotation of a sphere on its axis: cf. 44 D τὸ τοῦ παντὸς σχῆμα μυελό-μενοι περιφερές ὅν εἰς σφαιροειδὲς σῶμα ἐνέδραν.
8. ὡς...γεννησόμενον] The construction is that which is known as the accusative absolute: compare Protagoras 342.
with another, to make a common seed for all the race of mortals, he formed of them the marrow; and thereafter he implanted and fastened in it the several kinds of soul; and according to the number and fashion of the shapes that the soul should have corresponding to her kinds, into so many similar forms did he divide the marrow at the very outset of his distribution. And that which should be as it were a field to contain in it the divine seed he moulded in a spherical form all round; and this part of the marrow he called the brain, with the view that, when each animal was completed, the vessel containing it should be the head. But that which was to have the mortal part of soul which remained he distributed into moulds that were at once round and elongated: but he called all these forms marrow; and from these, as though from anchors, he put forth bonds to fasten all the soul, and then he wrought the entire body round about it, first building to fence it a covering of bone. And bone he formed in this way: having sifted out earth that was pure and smooth he kneaded and soaked it with marrow, and after that he placed it in fire; and next he set it in water, and again in fire, and once more in water: and thus having shifted it many times from one to another he made it indissoluble by either. Making use of this, he carved a bony sphere thereof to surround the brain, but on one side he left a narrow outlet; and around the marrow of the neck and back he made vertebrae of bone and set them to serve as pivots, beginning at the head and carrying them through the whole length of the body. Thus to preserve all the seed he enclosed it in a strong envelope, and he

C καὶ οἱ μὲν ὤτα τε κατάγωνται μιμοῦμενοι αὐτοῖς, καὶ ἱμάντας περιελίπονται καὶ ψυχογυμναστοῖς καὶ βραχεῖας ἀναβολὰς φοροῦσιν, ὡς δὴ τοῦτος κρατοῦσας τῶν Ἑλλήνων τοῦς Ἀκαδεμαῖοὺς.

10. στρογγύλα καὶ προμική] ‘Round and elongated’ is the same thing as ‘cylindrical’: this of course refers to the vertebral column.

12. πάσης ψυχῆς δεσμῶν] The brain and spinal marrow serve as conductors of vital force; it is on them that the soul immediately acts—the λογιστικὸν working through the brain, the ὄνομα through the spinal marrow—and they transmit her action to the rest of the body. The word δεσμῶν does not refer to any ligament or the like, nor has it any physical significance: it is purely metaphorical. For the phrase καθάπερ ἐξ ἀγκυρῶν compare 85 Ε ἔπεισε τὰ τῆς ψυχῆς αὐτῶν ὅλων νεὼς πείσματα.

13. περίβολον] The ms. reading περίβολον will no doubt yield a reasonable sense. But Valckenae’s correction is so much more apt that I have not hesitated to follow Hermann in accepting it. Below in 74 A we have λειτουργεῖ περίβολον ξυνεφράζειν.

15. μετὰ τοῦτο ἐις πῦρ] The process
is obviously suggested by the tempering of metal.

1. ἡθατέρου προσχρόμενος] This expression is very obscure; and no two interpreters agree as to its meaning. Stallbaum is entirely at sea: Lindau, at whom he scoffs, throws out a suggestion which is much more reasonable than anything in Stallbaum’s note: ‘eadem philosophorum corpora et animo tribuere principia gravitatemque eum et expansionem comparare cum ratione sensibusque’. Martin’s idea that ἡθατέρου δόναμις means the synovial fluid is extremely far-fetched: could Plato possibly expect any one to understand him if he made such use of language? Dr Jackson has suggested to me an interpretation which is certainly much more natural and, I think, right. We know that ἡθατέρον expresses plurality. Plato then, when he says that the gods used ἡθατέρου δόναμις in the construction of the bones, simply signifies that by means of joints they divided the bones into a number of parts, κάψεως καὶ κυψεως ἐνεκα. ἐν μέσῃ I take to mean between the bones—the joints represent the principle of ἡθατέρον, as being the cause of division and plurality.

4. διαπυρών τ’ αὐ γιγανομένην] That is to say, subjected to vicissitudes of temperature.

5. σφακελλόσαν] This is a medical term, signifying caries of the bones or gangrene of the flesh: it is also used of the blighting of plants; Aristotle de inventu v. 476 a 31 μεταίσ σφακελλόσει καὶ ἀστρόβητα γίνεσθαι τὸν ἄνθρωπον περὶ τῶν καρπῶν τούτων.

τὸ σπέρμα] i.e. τὸν μυελόν: cf. 73 C.

6. τὸ τῶν νεύρων] By νεύρα Plato always means tendons or ligaments, not nerves, which were entirely unknown to him. Aristotle always uses the word in the same sense: see de partibus animalium ii 11 et 647 b 16 τὸ ἄσπρα καὶ στερέα τῶν ὄσμομέρων ἐστὶν, οἷον ὅστις ἄκανθα νεύρων φλέγ. The nature, almost the existence, of the nerves was not discovered till considerably after Plato’s time: Erasistratos, who flourished in the next century, is said to have been the first who ascertained their functions. Aristotle seems to have had some sort of vague
made joints in it, using the power of the Other as an inter-
mediary between the parts, for the sake of moving and bending 
them. But deeming that the structure of bone was too rigid 
and inflexible, and that should it be inflamed and cooled again,
it would rot away and quickly destroy the seed within it, for this 
cause God devised the sinews and the flesh, that binding all the 
limbs together with the former he might by their tension and 
relaxation round their pivots enable the body to bend and ex-
tend itself; while the flesh he designed as a defence against 
heat and a shelter from cold; and moreover that it might be, 
like coverings of felt, a protection against falls, gently and easily 
yielding to external bodies; and containing a warm moisture 
within itself, in summer it might exude this, and spreading 
dampness on the surface might diffuse a natural coolness over 
all the body; but in winter on the other hand it might by its 
own fire afford a fair protection against the frost that assailed 
and surrounded it from without. Considering this, he that 
moulded us like wax made a mixture and blending of water 
and fire and earth; and compounding a ferment of acid and salt

knowledge of the optic and olfactory nerves, which he calls πόροι: cf. de partibus animalium ii xii 636b 16 ἐκ μὲν οὖν 
tῶν ὀφθαλμῶν οἱ πόροι φέρουσι εἰς τὰς περί τόν ἐγκέφαλον ϕλέξας τάλιν δ’ ἐκ τῶν ὀστῶν ὑσαίτως πῖρος εἰς τοῦπιθέν 
συνάπτει: also historia animalium i xvi 495a 11 φέρουσι δ’ ἐκ τοῦ ὀφθαλμοῦ τρεῖς πόροι εἰς τὸν ἐγκέφαλον, ὃ μὲν μέγιστος καὶ 
ὁ μέσος εἰς τὴν παρεγκεφαλίδα δ’ ἐλάχιστος εἰς αὐτὸν τὸν ἐγκέφαλον: ἐλάχιστος δ’ ἐστιν ὁ πόσ τῷ μυκτῆρι μάλιστα. About 
the auditory nerve he gives a very confused statement, apparently, as Martin observes, mistaken for it the Eusta-
chian tube: ibid. 492a 19 τοῦτο δ’ εἰς μὲν 
tῶν ἐγκέφαλον οὐκ ἔχει πῦρον, εἰς δ’ τῶν 
τῶν στόματος οὐρανόν. Aristotle’s notions 
concerning the brain are sufficient evi-
dence that he did not really understand 
anything about the nature of the nerves. 
That Alkmaion was acquainted with the 
optic nerves, notwithstanding the state-
ment of Kallisthenes adduced by Chalci-
dius, seems highly improbable: indeed 
the words of Kallisthenes, as there re-
ported, hardly amount to this.

9. προβολῆν ... πρόβλημα] There 
seems to be absolutely no difference in 
meaning between these two words, and 
the juxtaposition of two closely cognate 
forms without any distinction of sense is 
strange. Is it possible that we ought to 
read προβολῆν in both cases? Plato, like 
Sophokles, is given to repeating the same 
word with μὲν and δὲ; as in Phaedrus 
247 ο λαθορά μὲν αὐτὴν δικαιοσύνην, 
καθορὰ δὲ σωφροσύνη, καθορὰ δὲ ἐπι-
stήμην: see too below 87 η ποικίλλει μὲν 
.ποικίλλει δὲ. And there is quite suffi-
cient ornateness in the present passage to 
justify this rhetorical device. As to the 
construction, the future infinitives are sub-
stituted for the final clause: something 
like δ.νοήθη must be mentally supplied.

13. οἰκεῖον] contrasted with τὸν περι-
φερόμενον ἔξωθεν.

16. καὶ γὰρ] I see no sufficient reason
πλατώνος

ζύμωμα καὶ ὑπομίξας· αὐτοῖς, σάρκα ἔγχυμον καὶ μαλακὴν ξυνέ· διότι· τὴν δὲ τῶν νεύρων φύσιν ἐξ ὀστοῦ καὶ σαρκὸς ἀξίμων κράσεως μὴν ἐξ ἀμφοίν μέσην δυνάμει ξυνεκεράσατο, ξαιθὸν χρώματι προσχρώμειον. ὅθεν συντακτέραν μὲν καὶ γλυσχροτέραν σαρκῶν, μαλακωτέραν δὲ ὀστῶν ὑγρότεραν τε ἐκτήσατο δύναμιν νεῦρα. οἷς ξυμπεριλαβῶν ὁ θεὸς ὁστὰ καὶ μυελῶν, δήσας πρὸς ἀλλήλα νεῦρα, μετὰ ταῦτα σαρξί πάντα αὐτὰ κατεσκίασεν ἀνωθεν. ὅσα μὲν Ε. οὖν ἐμψυχή&ota;&ota;κα τῶν ὀστῶν ἢν, ὀλγυσταίς συνεφραττει σαρξί, ἀ δ' ἀνυχότατα ἐντὸς, πλείσταις καὶ πυκνώταταις. καὶ δὴ καὶ κατὰ τὰς ξυμβολάς τῶν ὀστῶν, ὅπη μή τινα ἀνάγκην ὁ λόγος ἀπέφανε δεῖν αὐτὰς εἶναι, βραχείαν σάρκα ἐγφυεν, ἵνα μήτε ἐμποδοῦν ταῖς καμπαίαις ὀσοὶ σύφορα τὰ σώματα ἀπεργάζωτο, ἀτε δυσκινήτας γυνόμενα, μήτ' αὐτοὶ πολλαὶ καὶ πυκναὶ σφόδρα τε ἐν ἀλλήλαις ἐμπεπλημέναι, διὰ στερεόταται ἀναισθηματί ἐμποιοῦσαί, δύσμην-μονεύσερα καὶ κοφότερα τὰ περὶ τὴν διάνοιαν ποιοῖν. διό δὴ τὸ τε τῶν μηρῶν καὶ κηνμών καὶ τὸ περὶ τὴν τῶν ισχιῶν φύσιν τὰ τε 75 Λ. τὰ περὶ τὰ τῶν βραχιόνων ὀστὰ καὶ τὰ τῶν πηχεων, καὶ ὅσα ἀλλα ἰμῶν ἀναρθρα, ὅσα τε ἐντός ὀστὰ δ' ὀλγυότατα ψυχῆς ἐν μυελῳ κέναι ἐστὶ φρονήσεως, ταῦτα πάντα συμπεπλήρωται σαρξίν. ὅσα δ' 20 ἐμφρονα, ἡττον, εἰ μῆ τοῦ τινα ἀυτὴν καθ' ἀυτὴν αἰσθήσεως ἔνεκα

1 καὶ ante ὑπομίξας omittunt AHZ. 3 εξ ἅμφοίν: συμμαφοίν supra scripto εξ Λ. 17 περὶ τὰ inclusi, quae retinet H. omittunt SZ.

for abandoning the reading of all the mss., since σάρκα is readily supplied as the object of ξυμβολὰς: and if γῆν be read, καὶ is positively had. The insertion of καὶ before ὑπομίξας seems to me, in this accumulation of participles, almost necessary, although it is lacking in A.

1. ξύμωμα] This means a fermented mixture: it would seem to be intended thereby to explain the combined softness and elasticity of flesh. Flesh could also be made of unfermented materials, as we presently see: εξ ὀστοῦ καὶ σαρκὸς ἀξίμων: but the difference in the composition is not stated.

2. τῆς τῶν νεύρων φύσιν] The description of νεῦρα tallies closely with that given by Hippokrates de locis in homine vol. II. p. 107 Kühn τὰ δὲ νεῦρα ξηρὰ τέ ἐστι καὶ ἁκολια καὶ πρὸς τῷ ὀστῶ περφύκαι, καὶ τρέφωντα δὲ τὸ πλεῖστον ἐκ τοῦ ὀστέου, τρέφωνται δὲ καὶ ἀνὸ τής σαρκός, καὶ τὴν χρονὶ καὶ τὴν ἱσχὺν μεταξύ τῆς σαρκὸς καὶ τοῦ ὀστοῦ περφύκαι. καὶ ὑγρότερα μὲν εἰσὶ τοῦ ὀστέου καὶ σαρκοειδέστερα, ξηρότερα δὲ ἡ ἀἱ σάρκες καὶ ὀστεοειδέστερα. This extract will explain the meaning of μέσην δυνάμει.

5. οἷς ξυμπεριλαβῶν] The reference of οἷς is to νεῦρα.

7. ὅσα μὲν οὖν ἐμψυχότατα] This rather curious expression denotes the bones which contain the greatest amount of marrow—marrow being the seat of life. By these are meant the bones of the skull and the vertebral process only; since it is clear from what Plato says a little below (ὅδ' ἐν τοῦ τῶν μηρῶν κ.τ.λ.) that he entirely distinguished be-
he mingled it with them and produced soft flesh full of sap: the sinews he composed of bone and unfermented flesh, a separate substance having an intermediate function; and to this he added a yellow colour. Accordingly the sinews received a power more firm and tenacious than the flesh, but more soft and flexible than the bones.

With these God covered the bones and marrow; and after he had bound one part to another with sinews, he enveloped them over all with flesh. Those bones which were chiefly inhabited by soul, he enclosed with the smallest amount of flesh; but those wherein was least soul he covered most abundantly and densely with it: moreover at the joints of the bones, save where reason showed that it ought to be there, he put but little flesh, that neither it might render the body unwieldy by hindering its flexions and impeding its motions, nor again that a dense mass of flesh piled together, producing by its hardness a dulness of sensation, might render the faculties of the mind too slow of memory and hard of apprehension. Wherefore the thighs and the shins and the parts about the hips and the bones in the upper arms and the fore-arms and all parts of our limbs which are without joints, and all bones which are devoid of intelligence owing to the small amount of soul inhering in marrow within them, all these are abundantly furnished with flesh; but those which are the seat of intelligence have less: except in cases between the substance contained in the spinal column and what we call 'marrow' in other bones, which he does not account as μυελός at all. Aristotle, owing to his complete misconception of the functions belonging to the brain and spinal marrow, is much less clear on this point: see de partibus animalium II v 651b 32. It is true that Plato assigns as the reason for the fleshiness of the arms, thighs, &c, that these bones are ἄναρθρα: still, had they contained μυελός, that would have been a reason for giving them a thin covering of flesh.

11. αὐτάς] sc. τὸς σάρκας.
14. ἣμπεπιλημέναι] If from too much crowding the substance of the flesh became very stiff and solid, the free motions of its particles would be impeded, and consequently sensations would with difficulty make their way to the consciousness: cf. 64 B. This rather seems to apply to the density of the flesh than to its quantity; but doubtless the same effect might be produced by both.

20. οἱ μὴ ποὺ] The only instance in which an acutely sensitive part is of a fleshy nature is when the flesh itself is the instrument of perception; as in the case of the tongue, and that only. Of course in all cases the external πάθημα is conveyed through the flesh to the conscious centre; but in general the flesh is only the medium of transmission, and the less flesh there is to traverse, the more speedily and clearly will the sen-

sation be registered in the consciousness. But in the case of the tongue, on the contrary, the fleshy structure is specifically adapted for the reception and discrimination of a particular class of sensations, and is no longer a mere passive medium. Hence Plato’s distinction is sound.

2. ë gár èx ánágkhs] That is to say, the conditions of the material nature to which our soul is linked will not admit of the combination of a dense covering of flesh with acute sensitiveness. This would have seemed too obvious to need pointing out, but for Stallbaum’s perverse comment ‘intelliget animum’. Of course Plato does not mean anything so absurd as to deny that the flesh of the thigh, for instance, is acutely sensitive: he only means that the thigh is kenon frwñoshws: it has no power of perceiving anything apart from the mere sense of touch residing in its nerves; whereas the parts containing ùmêlûs are centres of consciousness, and the fleshy structure of the tongue is the organ of a special mode of sensation.

4. múlístha ãár] Had such a combination been practicable, the gods would certainly have given the brain a more powerful protection than it now has: as it is, they sacrificed length of days and immunity from sickness to vividness of perception and power of reasoning. Aristotle attacks this doctrine because it does not fall in with his fantastic theory of the brain’s functions: see de partibus animalium ii xii 656a 15 ðò ãár õúppër tvîs légonwv, ðti el ñarâkûds ÿn, makróbòterwv ùn ÿn tò ñkron. állì èvânuðshsia ènèkew ñàárek èvai ûsâîn aíðshássæh mèn ãár tò ègkefûlæ, tûn ð' aîsthwv õú pròsleøsaí tâ mária tâ èrakûdû õlæwv. tòûtwv ð' ouðètèròn èstwv èlplhûs, ìllà tòllârâkoûs mèn õ tôtòs õw õ perî tòw ègkefûlæw tòwàntiôwv õn èpèrâj-

where God has formed the flesh to be in itself an organ of
sensation, as for instance the tongue: in most however it is as
aforesaid; for this material nature which comes into being by
the law of necessity and is reared with us does not allow dense
bone and much flesh to be accompanied by ready and keen per-
ception. For had these two conditions consented to combine,
the structure of the head would have displayed them in the
highest degree; and the human being, bearing upon it a fleshy
head, sinewy and strong, would have enjoyed a life twice, nay
many times as long as now, besides being much more healthy
and free from pain. But as it is, the creators who brought us to
being considered whether they should make a long-lived race
that was inferior, or one more short-lived which was nobler, and
they agreed that every one must by all means choose a shorter
and nobler life in preference to a longer but baser. Therefore
they covered the head with thin bone, but not with flesh
nor sinews, since it has no flexions. On all these grounds the
head that is set upon the body of every man is much quicker of
apprehension and understanding, but much weaker. For these
reasons and in this manner God placed the sinews all round the
base of the neck and cemented them with

aǔtός ἠστὼν ὄσπερ ὀτιών τῶν περιττω-
μάτων. Aristotle is, I believe, to a cer-
tain extent right in his assertion respect-
ing the ἀναισθησια of the brain; so that
we have here again an instance of his
drawing a false conclusion from correct
data. One might have supposed that he
who affirmed an ἀκλίνητος ἄρχη κινήσεως
need not have felt much difficulty about
an ἀναισθητός ἄρχη αισθήσεως.

αὐτά] i.e. a strong protective cover-
ing along with keenness of sensation.

13. σαρῆ δὲ καὶ νεῦρος] Hippo-
krates also denies that the head has νεῦρα:
de locis in homine vol. 11. p. 108 Kūhn
καὶ τὸ μὲν σώμα πᾶν ἐμπλεον νεῦρων, περὶ
δὲ τὸ πρόσωπον καὶ τὴν κεφαλήν οὐκ ἔστι
νεῦρα.

14. εὐαίσθητερα] i.e. more sen-
sitive than it would have been had the
gods taken a different view.

16. ἐπ' ἐσχάτην τὴν κεφαλήν] Plato
supposes the νεῦρα to pass up the neck
and terminate at the base of the head,
made fast to the jawbone.

17. ἐκάλλησεν ὄμοιότητι] It is im-
possible that ὄμοιότητι can simply stand
for ὅμοιος, as Stallbaum asserts; nor is
he justified by the passage he cites, Re-
public 555 λ, ἐτι οὖν, ἢν δ' ἐγώ, ἀπισ-
τούμεν μὴ κατὰ τὴν ὀλγαρχουμένην πόλιν
ὄμοιότητι τοῦ φειδωλόν τε καὶ χρηματιστήν
tετάχθαι; there obviously the meaning
is that the φειδωλός and χρηματιστὴν are
ranked as corresponding to the oligarchi-
cal state because of their resemblance to
it; and similarly in 576 ε, ὃ γε τυρα-
νικός κατὰ τὴν τυραννουμένην πόλιν ἀν εἰη
ὄμοιότητι. In like manner I think we
must take it here as an instrumental
dative.
This distinction differs from that of ἀναγκαία and θεία in 68 E; for here both ἀναγκαία and ἀρίστα are an end, not a means.

Somewhat similar is the metaphor in Phaedrus 243 D, ποτίσω λόγῳ οἷον ἀλμυρόν ἀκροβόλον. It is a metaphor of reminiscence or a kind of thought. It suggests that the words ποτίσω λόγῳ οἷον ἀλμυρόν ἀκροβόλον are not the words themselves but the idea they convey. It is a metaphor of thought and not of word.

The word ἀρίστον means 'best.' It is used by Plato and Aristotle to signify the highest good. It is also used by them to signify excellence or perfection. It is a word that is used to signify the best thing or the best possible.

The word ἀριστότοι means 'the best.' It is used by Aristotle to signify the best of his works or the best of his students. It is a word that is used to signify the best or the highest thing.
uniformity; and he fastened the extremities of the jaw-bones to them just under the face; and the rest he distributed over all the limbs, uniting joint to joint. And our framers ordained the functions of the mouth, furnishing it with teeth and tongue and lips, in the way it is now arranged, combining in their purpose the necessary and the best; for they devised the incoming with the necessary in view, but the outgoing with the most excellent. For all that enters in to give sustenance to the body is of necessity; but the stream of speech which flows out and ministers to understanding is of all streams the most noble and excellent. But as to the head, it was neither possible to leave it of bare bone, owing to the extremes of heat and cold in the seasons; nor yet by covering it over to allow it to become dull and senseless through the burden of flesh. Of the fleshy material as it was drying a larger film formed on the surface and separated itself; this is what is now called skin. This by the influence of the moisture of the brain combined and grew up and clothed the head all round: and the moisture rising up under the sutures saturated and closed it in on the crown, fastening it together like a knot. Now the form of the sutures is manifold, owing to the power of the soul’s revolutions and of the aliment; if these

I cannot see my way to any satisfactory emendation.

14. Δέρμα] Is this meant to be derived from λέμα? The νύν looks like it; and Plato’s etymological audacity has adventured things κύντερα than this.

διὰ τὴν περὶ τῶν ἐγκέφαλου νοτίδα] Plato is explaining how it comes to pass that the skull is covered with skin, although, according to his account, there is no flesh upon it. He regards it as an extension of the skin on the face and neck, which grows up over the head from all sides, being nourished by the moisture belonging to the brain, and meets on the summit (ἐνώπιον αὐτὸ πρὸς αὐτό). Thereupon the moisture, issuing through the sutures, penetrates the skin and causes it to take root on the head and to grow firmly together where it meets in the middle, as it were fastened in a knot (οἶνον ἀμμα ἕωςα γαγαγοῦσα).

17. τὸ δὲ τῶν ῥαφῶν] The number and diversity of the sutures depends upon the violence of the struggle described in 43 B foll. between the influx of aliment and the revolutions of the soul acting through the brain. There is a passage of Hippocrates which curiously falls in with Plato’s connexion of the sutures with the soul’s περιόδοι: de capitis vulneribus vol. III p. 347 Kühn δοτὶς μηδετέρωθι μηδεμιὰν προβολὴν ἔχει, αὐτὸς ἔχει τὰς ραφὰς τῆς κεφαλῆς ὡς γράμμα τὸ χεῖρ σφεται: that is to say, the rounder the head the more nearly does the form of the sutures approximate to that of the letter Χ, which is the form of the intersection of the two circles. When the head is prominent in front, says Hippocrates, the sutures resemble Τ; when protuberent behind, the figure is reversed, Ι; if protuberent both before and behind, the sutures form the figure Η. Thus in
so far as the shape of the head departs from the spherical or normal shape, in the same degree the sutures depart from the figure Χ; and in the same degree we may suppose the struggle between the periōdos and the κύμα to have been long and severe. The treatise concerning wounds on the head is one of those considered to be the genuine work of Hippokrates. In 92 A we find that in the lower animals the ἄργια τῶν περιφορῶν causes the head to assume an elongated shape.

2. τὸ θεῖον i.e. the brain, which is the seat of τὸ θεῖον. Plato now passes to the growth of the hair, which he thus explains. The skin of the head is punctured all over by the fire issuing from the brain: through the punctures moisture escapes, of which so much as is pure evaporates and disappears; but that which contains an admixture of the substances composing the skin is forced outward in a cylindrical form fitting the size of the punctures. But owing to the slowness of its growth and the resistance of the surrounding atmosphere, the hair is pushed backwards, so that the end becomes rooted under the skin. Thus the hair is composed of the same substance as the skin, but by refrigeration and compression has become more hard and dense. As to its identity with the skin Aristotle agrees: cf. de gen. anim. 11 vi 7452 20 ἄνωξες δὲ καὶ τρίχες καὶ κηρατα καὶ τὰ τοιαῦτα ἐκ τοῦ δέρματος, διὸ καὶ συμμεταβλάβλαιναι τῷ δέρματι τὸς χρῶς.

3. τρωθέντος] The suggestion τρο-θέντος is certainly tempting; but the mss. are unanimous, and I retain their reading,
contend more vehemently one with another, the sutures are more in number; but if less so, they are fewer. Now the whole of this skin was pricked all about with fire by the divine part: and when it was pierced and the moisture issued forth through it, all the moisture and heat which was pure vanished away; but that which was mingled with the substances whereof the skin was formed, being lifted up by the impulse, stretched far outwards, in fineness equalling the size of the puncture; but owing to the slowness of its motion it was thrust back by the surrounding air, and being forced in and rolled up under the skin it took root there. Under these conditions hair grows up in the skin, being of similar nature but of threadlike appearance, and made harder and denser by the contraction of cooling: for every hair in being separated from the skin was cooled and contracted. Hereby has our creator made our head hairy, using the means aforesaid, and conceiving that this instead of flesh should be a covering for the protection of the brain, being light and capable of affording shade from heat and shelter from cold, while it would be no hindrance in the way of ready apprehension. The threefold combination of sinew skin and bone in the fabric of the fingers, when dried, forms out of all a single hard skin, for the construction of which these substances served as means, but the true cause and purpose of its formation was the welfare of races not

though with considerable hesitation.

4. δέπηεν] They at once departed in the course of nature to their own habitation: but the earther thing, having no such impulse, was forced back by the pressure of the atmosphere.

8. ελλόμενον] 'rolled up': see note on 40 B.

13. αλτίως τοις ερημίνωις i.e. the subsidiary physical causes aforesaid: the final cause is given next.

16. γενησόμενον] Note the change of construction: the future participle stands in the place of δείν ελευ in the prior cause.

17. καταπλοχή] That is to say, the three substances of tendon skin and bone are interwoven into one homogeneous body and completely dried; out of this are formed the nails. Plato's statement here differs somewhat from Aristotle's as cited above.

20. τῶν ἐπείτα ἐστίνων ἐνεκα] This is a very singular declaration. The nails, by this account, are formed solely for the development they will afterwards attain in the inferior animals, as though they were of no use whatsoever to mankind. The importance of them is no doubt more conspicuous in beasts and birds; but Plato's theory certainly appears rather paradoxically to ignore their value to the human race. There is however a curious approximation to Darwinism in his statement: the nails appeared first in a rudimentary form in the human race; and afterwards in course of evolution the claws of the lion and the talons of the
eagle were developed from them. The notable point is that Plato evidently does not conceive that in the transmigrations any arbitrary change of form takes place, but that each successive organism is regularly developed out of its predecessors. Plato’s notion rests on no zoological evidence, so far as we know; it is but a brilliant guess: none the less, perhaps all the more, seeing that such evidence was not at his command, it is a mark of his keen scientific insight.

6. τρίχας <τ’> ὄνυχας τε] I have taken upon me to insert τε, since I do not believe δέρμα τρίχας ὄνυχας τε can be Greek. It may be noticed that this correction almost restores a hexameter verse: δέρμα τρίχας τ’ ὄνυχας τ’ ἐπ’, ἀκροι κωλοσιν ἐφυσαν.

Is Plato quoting from some old physical poet? Empedolcles might have written such a line.

76 E—77 C, c. xxxiv. So when all the parts of the human frame had been combined in a body for ever suffering waste by fire and by air, the gods devised a means of its replenishment. They took wild plants and trained them by cultivation, so that they were fit for human sustenance. Plants are living and conscious beings; but they have the appetitive soul alone; they grow of their inborn vital force, without impulse from without; they are stationary in one place, and cannot reflect upon their own nature.

9. μέρη καὶ μέλη] For this combination compare Lais 795 E τῶν τοῦ σῶματος αὐτοῦ μέλων τε καὶ μερῶν: and Philodnus 14 Ε ὅταν τίς ἐκαστοῦ τὰ μέλη τε καὶ ἀμα μέρη διελθῶν τῷ λόγῳ. The distinction between the terms is thus defined by Aristotle Historia Animalium 1 i 486§ 8 τῶν δ’ τοιούτων ἔνα οὐ μόνον μέρη ἄλλα καὶ μέλη καλεῖται: τοιαύτα δ’ ἐστὶν διὰ τῶν μερῶν ὡλὰ ὡς ἐπερά μέρη ἔχει εν αὐτοῖς, ὅλων κεφαλὴ καὶ σκέλος καὶ χείρ καὶ ὄλος ὁ βραχίων καὶ ὁ θώραξ· ταύτα γάρ αὐτὰ τέ ἐστι μέρη διὰ, καὶ ἐστὶν αὐτῶν ἐπιά γεμάτη. Α μέλος then is that which is part of a whole, but is yet in itself a definite whole.

τὴν δὲ ζωῆν ἐν πυρὶ καὶ πνεύματι] Man’s life is said to depend on fire and air because these are the agents of digestion and respiration, as we shall see in the next two chapters; cf. 78 D. These two elements in fact keep up the vital movement of the human body.

10. τηκόμενον κενούμενον τε] Sc,
yet existing. For our creators were aware that men should pass into women, and afterwards into beasts; and they knew that many creatures would need the aid of nails for many purposes: wherefore at the very birth of the human race they fashioned the rudiments of nails. On such reasoning and with such purposes did they form skin and hair, and on the extremities of the limbs nails.

XXXIV. Now when all the parts and members of the mortal being were created in union, and since his life was made perforce dependent upon fire and air, and therefore his body suffered waste through being dissolved and left void by these, the gods devised succour for him. They engendered another nature akin to the nature of man, blending it with other forms and sensations, so as to be another kind of animal. These are

Plato enters more fully into this in 88c foll.

12. ἄλλας ἴδεας καὶ αἰσθήσεως] Plants are akin to the nature of mankind, inasmuch as they are animated by the same vital principle and are formed out of similar physical materials, so that they are able to repair the waste of the human structure. But the form of these organisms is diverse from man’s, and their mode of sensation is peculiar to themselves. Whether Plato was a vegetarian or not, it is clear that he regards vegetables as the natural and primeval food of man: see below 80ε, and Ἐρινώμης 975.A ἄσω δὴ πρῶτον μὲν ἦ τὰς ἄλληλοφαγίας τῶν ᾱδόν ἡμᾶς τῶν μὲν, ὡς ὅ μύθος ἦστι, τὸ παράπαν ἀποστήσασα, τῶν δὲ εἰς τὴν νήμιμον ἐδώθην καταστήσασα. We must of course allow for the possibility that the author of the Ἐρινώμης has overstated Plato’s disapprobation of animal diet.

13. δὲ δὴ τῶν ἡμέρα δένδρα] So then the device of the gods for the preservation of human life was not the invention of plants, but their cultivation: plants themselves existed as part of the general order of nature. It thus appears that in Plato’s scheme plants do not, like the inferior animals, arise by degeneration from the human form. For as soon as man was first created, he would have need of plants to provide him with sustenance. It would appear then that in the Platonic mythology the erring soul in the course of her transmigrations does not enter any of the forms of plant-life; though the contrary was the belief of Empedokles—ἡδη γάρ ποτ’ ἐγὼ ἰερότμην κοῦρός τε κόρη τε | θάμνος τ’ οἴσων τε καὶ εἴη ἀλλ’ Ἐλλόπος ἵχθος. Martin however is mistaken in inferring this conclusion from the fact that plants possess only the third ἔδος of soul; this third ἔδος is simply the one vital force acting exclusively through matter—a degree of degeneracy to which any human soul, according to the theory of metempsychosis, might sink: indeed there are forms of what we call animal life, which are clearly within the limits of transmigration, but which possess little, if any, more independent activity of ψυχή than do plants. The simultaneous appearance of mankind and of plants in the world, while all intermediate forms of animal life are absent, is curious, and could hardly, I think, be defended upon ontological grounds.
2. ἱσχε] i.e. attained the condition in which now they are
3. πάν γὰρ οὖν] This passage is of the highest importance, as proving beyond controversy that Plato in the fullest degree maintained the unity of all life. He drew no arbitrary line between 'animal' and 'vegetable' life: all things that live are manifestations of the same eternal essence: only as this evolved itself through countless gradations of existence, the lower ranks of organisms possess less and less of the pure activity of soul operating by herself, until in plants and the lowest forms of animal life the vital force only manifests itself in the power of sensation and growth.

Aristotle agrees with Plato in ascribing to plants ψυχή and ὕψη, but he does not allow them αἰσθήσεις: see de anima i ν 410b 23 φαίνεται γὰρ τὰ φυτὰ ἣν οὐ μετέχοντα φορᾶς καὶ αἰσθήσεως: cf. 11 ii 413a 25, and de partibus animalium i 1 641b 6. They had according to him the ὑποτική ψυχή alone: de anima 11 ii 413b 7 ὑποτικῶν δὲ λέγωμε τὸ τοιούτων μόρων τῆς ψυχῆς ὡς καὶ τὰ φυτὰ μετέχει. This coincides with Plato's statement. Aristotle however draws the distinction between ψυχή and φυτά that the former possess αἰσθήσεις, the latter possess it not: de invent. i 467b 24 τὰ μὲν φυτὰ ὡς μὲν, οὐκ ἔχει δ' αἰσθήσεως τῷ δ' αἰσθάνεσθαι τὸ ὄξον πρὸς τὸ μῆ τὸ ὄξον διο-

φίον. See however hist. anim. viii i.

In the pseudo-Aristotelian treatise de plantis i 815b 16 it is affirmed that Anaxagoras Empedokles and Demokritos attributed thought and knowledge to plants: ὁ δὲ Ἀναξαγόρας καὶ ὁ Δημόκριτος καὶ ὁ Ἐμπεδοκλῆς καὶ νοῦν καὶ γνῶνων εἰ-

πον ἔχου τὰ φυτά: they of course as-

signed them ἐπιθυμία καὶ αἰσθήσεις also: ibid. 815a 15 Ἀναξαγόρας μὲν οὖν καὶ Ἐμπεδοκλῆς ἐπιθυμία ταῦτα κινεῖθαι λέ-

γοὺσιν, αἰσθάνεσθαι ταῦτα καὶ λυπέσθαι καὶ ἤδεσθαι διαβεβαιούται, ὥν ὁ μὲν Ἀνα-

αξαγόρας καὶ ὅτα ἠναι καὶ ἤδεσθαι καὶ λυ-

πέσθαι εἰπε, τῇ τῇ ἀπορροῇ τῶν φύλλων καὶ τῇ αὐξῆσθαι τοῦτο ἑκατομβέουν ὁ δὲ Ἐμπεδοκλῆς γένος ἐν τούτοις κεκραμένων εἶναι ἐδοξάσεις. Sextus Empiricus adv. math. viii 286 confirms the statement that Empedokles allowed reason to plants: πάντα γὰρ ἐσθὶ φύσις ἔχει καὶ νόματος ἀλογ. Diogenes of Apollonia was of a contrary opinion: Theophrastos de sensu § 44 τὰ δὲ φυτὰ διὰ τὸ μῆ εἶναι κοίλα μηδὲ ἀναδέχεσθαι τὸν ἄριστον πατελὸς ἀφη-

ρηθαίναι τὸ φρονεῖν. In our estimate of such statements however we must allow for the fact that these early philosophers only very imperfectly distinguished between αἰσθάνεσθαι and φρονεῖν: Theo-

phrastos says of Parmenides τὸ γὰρ αἰσθάνεσθαι καὶ τὸ φρονεῖν ὡς ταῦτῳ λέγει: 10 αὐτοῦ: αὐτοῦ Α.
the cultivated trees and plants and seeds, which are now trained by culture and domesticated with us; but formerly there existed only the wild kinds, which are older than the cultivated. For indeed everything which partakes of life may with perfect justice and fitness be termed an animal; but the kind of which we are now speaking shares only the third form of soul, which our theory says is seated between the midriff and the navel, and which has nothing to do with opinion and reasoning and thought, but only with sensation, pleasant or painful, with appetites accompanying. For it ever continues passively receptive of all sensations, and having its circulation in itself about its own centre, it rejects all motion from without and uses only its own; but its nature has not bestowed upon it any power of observing its own being and reflecting thereon. Wherefore it is indeed alive and in no wise differs from an animal, but it is

and this is no doubt still more true of others.

7. αὐθήσεως δὲ] The ὀρεστικὴ δύναμις, though not explicitly mentioned here, is of course included, as we see from the account of the τρότον εἴδος in 70 D foll.

8. πᾶσχον γὰρ διατελεῖ πάντα] i.e. it passively submits to the influences which work upon it: since it does not possess the two more active forms of soul, the passive conditions of nutrition growth and decay, together with sensation, are all that belong to it.

ὀπραφίντι δ᾽ αὐτῷ ἐν ἑαυτῷ] That is to say, its motions, e.g. the circulation of the sap, take place within it: its movement is not κατὰ τόπον, but ἐν ταύτῃ.

9. τὴν μὲν ἡξωθὴν ἀπωσαμένων] It rejects motion from without and avails itself of its own innate force: that is, its growth is not due to any external compulsion, but the development of its own impulse. As Aristotle would put it, a plant has its proper motion κατὰ φύσιν, the motion ἡξωθὴν only κατὰ συμβεβηκός. Plato means that it αὐτὸ ἐμφύει κινεῖ and therefore must possess ψυχὴ, which alone is self-moved.

10. τῶν αὐτοῦ τι λογίσασθαι κατ᾽ ὀπίνιαν φόσω] i.e. it is conscious, but not self-conscious. Man can look into his own consciousness and realise his own identity and personality: he can speculate upon his relation to other personalities and to the sensible objects around him. The plant can do none of this: it can but take its sensations as they come, without inquiring what they are, what it is that feels them, what is the line of continuity that binds them together. The meaning of this phrase is plain enough; but the expression of it is a little strange. There is an overwhelming preponderance of ms. evidence in favour of φόσει, and I am not sure that it ought not to be restored: Schneider however is alone, I believe, in adopting it.

11. ἐστι τε οὖχ ἔτερον ἐς ὑμῖν] It would seem a necessary consequence that a thing which ἐστὶ is ἐς ὑμῖν: and Aristotle is perhaps somewhat inconsistent in allowing plants Ἐστὶν, while refusing them the title of ἐς. Also Plato seems more scientific than Aristotle in attributing ἀληθεία to plants. What manner of ἀληθεία belongs to plants may or may not be dis-
covered or discoverable by science; but it seems at least improbable that anywhere a hard and fast line can be drawn between the άλοσθαί of animals, from man down to the zoophyte, and the corresponding πάθος in plants. Plato here as everywhere in his system preserves the principle of continuity, the germ of which he inherited from Herakleitos, and which attained so astonishing a development in his hands. Brief as is Plato's treatment of the subject, the union of poetical imagination and scientific grasp which it displays renders this short chapter on plants singularly interesting. And but for it, we should have been forced inferentially to fill up a space in his theory, for which we now have the authority of his explicit statement.

1. τής ύφ' ἑαυτοῦ κινήσεως ἀστερήσας] This is not inconsistent, though at first sight it may appear so, with τῷ ἄκελα κρυπταμένω above. For there the question was of motion ἐν τῷ ἀκτίφι, now it is of motion from place to place. The plant is free to carry on all its natural movements within its own structure, but it is incapable of transferring itself from place to place. Yet this stationary condition is no reason for refusing it the name of τόν: for indeed the κόσμος itself has its motion only ἐν τῷ ἀκτίφι. Galen evidently had τής ἑαυτοῦ, for he proposes to read εξω: ἑνοςκον λειπέν τῷ στοιχείῳ, γραψαντι τοῦ Πλάτωνος διὰ τό τῆς ἑξω ἑαυτοῦ. The emendation does him credit: but there is no reason for interfering with our present text.

77 c—79 A, c. xxxv. Then the gods made two channels down the body, embedded in the flesh, on either side of the spine, to irrigate it with blood: and at the head they left the veins and caused them to cross each other transversely, that the head might be firmly fixed on the neck, and that communication might be preserved between both sides of the body. This scheme for the irrigation of the body we shall best understand, if we reflect that all substances composed of finer particles exclude those of coarser, while the coarser are easily penetrated by the finer. So then when food and drink enter the belly, they are retained; but fire and air are too subtle to be confined therein. Therefore the gods wove a web of fire and of air spread over the cavity of the body and
stationary and rooted fast, because it has been denied the power of self-motion.

XXXV. Thus did the higher powers create all these kinds as sustenance for us who were feeble; and next they made canals in the substance of our body, as though they were cutting runnels in a garden, that it might be irrigated as by an inflowing stream. And first they carried like hidden rills, under the place where the skin and the flesh are joined, two veins down the back, following the twofold division of the body into right and left. These they brought down on either side of the spine and the seminal marrow, first in order that this might be most vigorous, next that the current might have an easy flow downwards and render the irrigation regular. After that, they cleft the veins around the head, and interweaving them crossed them in opposite directions, carrying these from the right side of the body to the left and those from the left to the right. This

placed therein two lesser webs opening into the mouth and nostrils. And they
made alternately the great web to flow towards the lesser webs, and again the lesser towards the greater. In the former case the airy envelope of the greater web penetrated through the porous sub-
stance of the body to the cavity within, in the latter the lesser webs passed through the body outwards; and in either case the fire followed with the air. This alternation is kept up per-
petually so long as a man lives, and we give it the name of respiration. And so when the fire, passing to and fro, en-
counters food and drink in the stomach, it dissolves them and driving them onwards forces them to flow through the veins, like water drawn into pipes from a fountain.

3. οἱ κρείττοις] Plato several times applies this phrase to supernal powers: cf. Sophist 216 B ἀνάφηκας εἰς καὶ σοὶ τις ὑών τῶν κρείττων συνηδίσκω, φαῆλοις ἑώρας ὅταν ἐν τοῖς λόγοις ἐπολύθησος τὲ καὶ ἐνεγκαλοῦσ, θεὸς τις ὅπως ἐνεγκαλικός: Symposium 188 D τοῖς κρείττοις ἡμῶν θεοῖς: Euthydemus 291 A μὴ τις τῶν κρείττων παρὼν αὐτά ἐφηβήγατο: the

last passage being ironical.

4. τῆς ὑχετού...] cf. 70 εἰς τὰς ἀρτηρίας ὑχετοῦ ἐπὶ τὸν πλεύσμων ἐπετοῦν.

7. δύο φλέβας] The two 'veins' are, according to Martin, the aorta and the vena cava.

8. δεξιῶς τε καὶ ἀριστερῶς δὲν] i.e. with right and left sides: I doubt whether μέρησιν is to be supplied, any more than μέρη with the phrases ἐπὶ δεξιά, ἐπὶ ἀριστερά.

9. τῶν γόνιμοι...μυελῶν] cf. 73 C.

11. ἐπὶ κάταντες] As Galen objects, this seems to leave out of sight the circu-
luation of the blood in the head and neck, which would be ἀναντεῖς.

14. ἐκ τῶν δεξιῶν ἐπὶ τάριστερά] Plato makes the blood-vessels belonging to the right side of the head pass to the left side of the body and vice versa for two reasons: first that the consequent interlacing of the veins might fasten the head (which we have seen to be destitute of νεῦρα) firmly on the trunk; secondly that the sensations might be conveyed from either side of the brain to the opposite side of the body, and so all parts of the body might be kept in communica-
tion. The notion that the blood-vessels are wanted to fasten the head is of course erroneous; the latter part of his theory, had nerves but been substituted for veins, is a nearer guess at the truth.

5. τὸ δὲ ἐνεύθεν ἡδή] cf. Galen de plac. Hipp. et Plat. viii 706 τὸ μὲν οὖν ἄρει καὶ πυρὶ χρήσται τὴν φύσιν πρὸς πέλμην τροφῆς αλμάστων τε καὶ ἀνάδοσιν ὅρθως ἔληται, τὸ δὲ ἐξ αὐτῶν πλέγμα γεγονέναι καὶ μὴ διὰ ὅλων κράσων οὐκέτι ἐκατόν, καθάπερ οὖδὲ τὸ πῦρ ὀνόμαξιν αὐτῶν [ἢ αὐτό], ἐνώ, ὡς Ἰπποκράτης, ἐμφυτον θερμῶν. The principle that smaller particles can pass through the interstices of larger ones, while the larger cannot penetrate the smaller, is thus applied by Plato to explain the process of digestion: the nutriment swallowed must on the one hand have a receptacle provided which is able to contain it, while on the other hand it must be subjected to the action of fire. The walls of the receptacle are therefore constructed of material sufficiently fine to retain the food, but not fine enough to arrest the passage of fire and air: the two latter therefore are enabled to circulate freely through the substance and lining of the body and to act upon the food contained within it. It will thus be seen that Plato conceives respiration solely as subsidiary to digestion: an opinion which is perhaps peculiar to him alone among ancient thinkers: the ordinary view being that its function was to regulate the temperature of the body, as thought Aristotle: cf. de respiratione xvi 473a 28 καταπύξεως μὲν οὖν ὅλως ἂ τῶν ἰχνῶν δεῖται φύσις, διὰ τὴν ἐν τῇ καρδίᾳ τῆς ψυχῆς ἐμπύρωσιν. ταύτην δὲ ποιεῖται διὰ τῆς ἀναπνοῆς. Demokritos thought it served to keep up the supply of ψυχή in the body: ἵδια. iv 471b 30 f.: not, Aristotle observes, that Demokritos conceived that Nature designed it for that end; ὅλως γὰρ, ὡσπερ καὶ οἱ ἄλλοι φυσικοί, καὶ αὐτὸς οὖν ἅπτεται τῆς τοιαύτης αἰτίας.

8. πῦρ δὲ πάντων γενών] Air seems more concerned with the process of respiration; but we must remember that in Plato's view fire was the actual instrument of assimilating the food, and also that it was the agent which started the
they did, partly in order that together with the skin they might form a bond to fasten the head to the body, seeing that it was not set round with sinews on the crown; and also that this might be a means of distributing from each side throughout the whole body the sensation due to the perceptions. And next to this they designed the irrigation on a kind of plan which we shall better discern by assuming the following premises. All bodies which are composed of smaller particles exclude the larger, but the larger cannot exclude the smaller. Fire is composed of finer particles than any other element, whence it penetrates through water and earth and air and whatever is composed of them, and nothing can keep it out. This rule must also be applied to the human belly; when food and drink enter into it, it keeps them in; but air and fire, being finer than its own structure, it cannot keep in. Accordingly God used these two elements for the conveyance of liquid from the belly to the veins, weaving of air and fire a network

air in its oscillations, cf. 79 D. Air then plays a part only subsidiary to fire.

13. τούτους οὖν καταξήσατο] He used fire and air (1) for the conversion of the food into blood, (2) for its conveyance into the blood-vessels.

15. πλέγμα ἐς ἀέρος καὶ πυρὸς] This theory of respiration is by far the most obscure and perplexing of Plato’s physiological lucubrations, partly owing to the enigmatical form in which it is expressed, partly to actual gaps in the exposition. An important light however is thrown upon it by a fragment of Galen’s treatise on the Timaeus, which deals with this passage. This fragment, which was previously known only in an imperfect Latin translation, was found by M. Darenberg in the Paris library and published by him in 1848. On Galen’s commentary the ensuing explanation is based: I cannot however persuade myself that it fully clears up statements which Galen himself declares to be δυσνόητα τε καὶ διάβαρυτα.

First we must determine the meaning of κύρτος and ἐγκύρτιον. The first was a fishing-trap, or weel, woven of reeds; it seems to have had a narrow funnel-shaped neck, through which the fish entered, but was unable to return, owing to the points of the reeds being set against it. (Martin conceives it to consist of two baskets, one fitting into the other; but Galen says it is ἀπλοῦν.) The ἐγκύρτιον—a word which is only found in the present passage—is explained by Stallbaum (whom Liddell and Scott follow) to mean the entrance or neck of the κύρτος. But on this point Galen is explicit: he says it is βμοιον μὲν τῷ μεγάλῳ, μικρὸν δὲ. We must therefore conceive the ἐγκύρτια to be two smaller κύρτοι similar to the larger, contained within it and opening into its neck.

Applying these premises, we shall find that the κύρτος or large πλέγμα consists of two layers, one of fire, one of air. The outer layer (τὸ κύρτος) is the stratum of air in contact with all the outer surface of the body; the inner layer (τὸ ἐνδον τὸν πλοκάνου) is the vital heat contained in the blood and pervading all the substance of the body between the skin and the cavity within. The two ἐγκύρτια, which are formed entirely of air, represent re-
respectively the thoracic and abdominal cavities of the body: the first having a double outlet, one by the larynx, the other by the orifices of the nostrils: the second has one outlet only, through the oesophagus into the mouth. These preliminaries laid down, we shall be able to understand more or less precisely the remaining statements in the chapter. Marvin's interpretation, which is most lucidly stated, would probably have been modified had the commentary of Galen in the original been before him.

I give a diagram, which, without aiming at anatomical accuracy, may perhaps help to elucidate Plato's meaning.

1. διπλά κατά τήν ἐκσόδον i.e. having two separate entrances, the wind-pipe and the oesophagus, one to each ἐγκύρτιον.

2. διπλά δικρούν] The ἐγκύρτιον occupying the cavity of the thorax he constructed with a double outlet, one by the larynx through the mouth, the other through the nostrils.

3. τά μὲν οὖν ἐνδον ἐκ πυρὸς This is the inner layer of the κύρτος, which, as we have seen, consisted of the vital heat contained in the solid part of the body lying between the surrounding air and the ἐγκύρτια, or cavities within.

6. τὰ μὲν τῶν ἐγκύρτιων] Galen warns us against taking this ‘one of the ἐγκύρτια’, in which case, as he justly remarks,
like a fish-trap or weel, having two lesser weels within with a double inlet; one of which inlets he again wove with two passages; and from the lesser weels he stretched as it were cords on all sides to the extremities of the network. All the inner part of the net he constructed of fire, but the lesser weels and the envelope he made of airy substance; and he took the net and wrapped it in manner following about the animal he had moulded. The structure of the lesser weels he carried into the mouth: and, these being twofold, he let down one of them by the windpipe into the lungs, the other past the windpipe into the belly. The one weel he split in two, and let both inlets meet by the passages of the nostrils, so that when the first inlet was not in action by way of the mouth, all its currents also might be replenished from the second. But with the general surface of the network he enveloped all the hollow part of our body; and all this, seeing it was air, he now caused to flow gently into the lesser weels, now made them flow back upon it; and since the body is of porous texture, the network passes through it inward and again outward, and the beams of fire

Plato would have gone on 'τὸ δὲ εἰς τὸν σώματος'. He understands πλόκανων, in which he is probably right. The subdivision of the πλόκανων into the two ἐγκύρται begins at διπλῶν δὲ δυτος αὐτών.

7. τὰς ἀρτηρίας] Σee the note on 70 C.

8. τὸ δὲ εἰς τὴν κοιλᾶν] The other ἐγκύρται, occupying the abdominal cavity, had its outlet past the windpipe by way of the oesophagus: this had only one opening.

9. τὸ δὲ άετερον] The ἐγκύρται which occupied the chest had a twofold outlet, one through the mouth, the other through the nose; and this latter was again divided into the two channels of the nostrils. The object of this double outlet was to allow respiration to be carried on through the nostrils when the passage by way of the mouth was not working, that we might not always have to open our mouths in order to breathe.

12. τὸ δ’ ἄλλο κύτως] i.e. the stratum of air in contact with the body. This first, penetrating through the porous substance of the flesh, flows through it into the cavity of the ἐγκύρται, the airy contents of which have passed up through the passages of respiration: presently the ἐγκύρται flow down again into the body, and the air that had come in through the flesh passes forth again by the way that it came. The inner layer of the κήρτος, which was formed of fire, also oscillates to and fro, accompanying the motions of the airy envelope. And this oscillation must ceaselessly continue so long as we live. There are then two modes by which the air effects an entrance into the interior of the body: one by way of the tubes and orifices constructed for that purpose; the other through the substance of the body, which is too porous to bar its ingress, seeing that the flesh is partly constructed out of the coarser elements of water and earth.

16. τὰς δὲ ἑντός τοῦ πυρὸς ἀκτίνας]
This is the same as ἡ ἐνδον τοῦ πλοκάνων above: i.e. the ἐξωφονοιθεὶς, or vital heat residing in the substance of the body.

3. ἀναπνοήν καὶ ἐκπνοήν] Plato uses the word ἀναπνοή for what was later termed εἰσπνοή, ἀναπνοή being reserved for the whole process of εἰσπνοή + ἐκπνοή. Aristotle uses ἀναπνοή similarly: de respiratione xxi 480b 9 καλεῖται δ' ἡ μὲν εἰσόδος τοῦ ἀέρος ἀναπνοή, ἡ δ' ἕξοδος ἐκπνοή. The dynamical cause of inspiration and expiration is explained in the next chapter.

5. ἀρδομένῳ καὶ ἀναψυχομένῳ] It would appear from this that Plato did regard respiration as serving the purpose of tempering the vital heat of the body: but this is a merely secondary object; its chief end being to effect the digestion of the food.

6. τῆς ἀναπνοῆς] Here ἀναπνοή is simply equivalent to the breath.

8. διὰ τῆς κοιλάς εἰσελθόν] The air and the fire which accompanies it, in the course of its oscillation to and fro, encounter the food which has been received into the body; and since it is composed of much finer particles than the latter, they penetrate and divide the food, converting it into blood (the red colour is due to the tinge imparted by fire as we find at 80 Ε); and then they drive the now fluid substance through the small vessels which they themselves permeate, and so pump it into the veins.

11. ὡστερ ἀυλῶνος] The body is compared to an aqueduct through which the veins pass as pipes or conduits irrigating all parts of it. The metaphor has become a little mixed here; above the body was likened to the κηποί which had to be watered.

79 Α—Ε, c. xxxvi. Let us more closely examine the conditions of the process described in the foregoing chapter. The cause of it is that there is no void space in the nature of things. Therefore when the breath issues forth of the mouth it thrusts against the neighbouring air, which transmits the impulse till it is received by the air in immediate contact with the body: this then forces its way in through the pores and replenishes the space within which the departing air leaves. Again this newly entered air, passing out once more through the pores of the body, in its turn thrusts the outside air and forces it to pass inward again through the passages of respiration to replenish the deserted space: and this process goes on continually, like a wheel turning to and fro. The cause of this oscillation is the vital heat which re-
which are confined within follow the air as it moves in either direction: and this never ceases to go on so long as the mortal creature holds together. To this process he who appointed names gave, we say, the titles of inspiration and expiration: and from this condition, both active and passive, it has come about that our body, deriving moisture and coolness, has its sustenance and life. For when, as the respiration passes in and out, the interwoven fire within follows it and entering the belly swings up and down and meets the food and drink, it dissolves them, and reducing them to small particles, drives them along the channels through which it flows, pumping them into the veins like spring-water into conduits, and so it makes the current of the veins flow through the body as through an aqueduct.

XXXVI. Let us once more examine the process of respira-

sides in the body. For the air within the body, being warmed thereby, rushes upward through the mouth and nose, and the cool air surrounding the body rushes in through the pores. Then this in its turn, becoming heated, rushes out through the pores, and the cool external air comes in through the passages of the breath. And thus a perpetual alternation of inspiration and expiration is kept up for the preservation of life.

Plato's theory then depends (1) upon his principle of περίωσις, by which he has explained the melting of metals &c, and by which in the next chapter he explains a variety of natural phenomena; (2) upon the vibration of the ύποδοχή, which causes every element to strive towards its proper situation in space.

12. πάλιν δὲ Plato's theory falls into two parts; in the first he simply describes the process, in the second he points out the physical causes of it. His theory bears a certain resemblance to that of Empedokles, which will be found in a passage quoted by Aristotle de respiratione vi 473b 9, 275—299 Karsten. According to his statement, which is not very clear, the blood-vessels are only partially filled with blood; and when the blood rushes one way, the air follows through the pores into the body; when the blood moves in the other direction, the air is again expelled through the pores: this he illustrates by the analogy of a girl playing with a clepsydra; she covers the mouth with her hand and then plunges the instrument in water: the air, detained in the vessel by her hand, will not suffer the water to enter through the perforations; when she removes her hand the water enters at the bottom and expels the air through the mouth: similarly if the vessel is full of water, the air is unable to find entrance, but passes in as the water flows out.

Aristotle criticises Plato's theory in de respiratione v 472b 6 foll.: it does not explain, he says, why only land animals breathe, or if fishes &c do so also, how they do it; again it assumes that ἐκπνοή is prior to ἐλπνοή, the contrary being the case; γίνεται μὲν γὰρ ταῦτα παρ' ἄλληλα, τελευτώντες δὲ ἑκπνοοῦσιν, ὥστ' ἀναγκαῖον εἶναι τὴν ἀρχὴν ἐλπνοοῦν. Aristotle's own mechanical explanation is given in de resp. xxi 480a 16. More
cogent arguments against the Platonic account are adduced by Galen de plac. Hipp. et Plat. VIII 708 f.oll.; his chief objection being that Plato ignores respiration as a voluntary action; also Galen prefers οἷκη to περὶωσις as its cause.

6. περιελανυμένον] The outside air receives as a whole an impulse from the breath essaying to issue forth. Now the only region in which it is possible for it to yield to this impulse is that which is being vacated by the issuing air. It matters not therefore in what direction the originating impulse is given: if room is to be found outside the body for the breath as it comes forth, it must be by an equal quantity of air entering the cavity which it quits.

8. προχοῦ περιαγομένου] The 'wheel' does not move in continuous revolution, but alternately describes first a semicircle forward then a semicircle backward utique ad infinitum: cf. Galen de plac. VIII 711.

14. τὴν δὲ αἰτίαν τῆς ἀρχῆς] Hither-to the περὶωσις has been the physical law alleged; now comes in the other principle, the vibration of the ὑποδχύ, which is the primary motive power producing respiration. The original motion is due to the fire within the body which constitutes its vital heat. The air within the ἐγκύρτια, coming in contact with this fire, becomes heated; that is, is mingled
tion and the causes which have led to its present conditions. These are as follows. Since there is no void into which any moving body could enter, and since the breath issues forth from us, the consequence is clear to every one: instead of entering into a void space it thrusts the neighbouring matter out of its place. And this, yielding to the thrust, drives before it that which is immediately nearest; and all being driven round by this compulsion enters into the place whence the breath came forth, and replenishing the same follows after the breath; and this whole process goes on like the rotation of a wheel, because there is no void. Therefore when the cavity of the chest and the lungs send forth the breath, they are again replenished by the air surrounding the body, which penetrates inwards through the flesh, seeing it is porous, and is forced round in a circuit. And again when the air returns and passes forth through the body, it thrusts the breath back again inwards through the passages of the mouth and nostrils. The cause which sets this principle in action we may describe thus. In every animal the inner parts about the blood and veins are the hottest, as if there were a fount of fire contained in it. This is what we compare to the network of the weel, supposing that all the part extending from the middle to the sides is woven of fire, but the outer part of air. Now we must admit that the heat naturally tends outwards to its own region and its own kin. And whereas there are two means of egress, one out through the body, the other by way of the mouth and nostrils, when it makes for one exit, it impels the air round towards the other. And the air so impelled falling into the fire

with fire. Now fire, as we know, ever seeks to escape upwards to its own region; therefore the mixture of air and fire is impelled to quit the body in search of its own kind. This it may do by either of two outlets—by penetrating through the porous substance of the body, or by passing upward through the respiratory passages. Whichever of these passages it selects, it thrusts against the air outside, and each particle of air pressing upon its neighbour, the air nearest the body is forced into the body by the other entrance. The original impulse then is given by the fire in the body seeking to escape to its own kindred element.

17. προσενεκάζομεν τῷ τοῦ κύρτου πλάγματι This seems sufficiently to confirm the explanation of the κύρτος given above, and the identification of the inner layer thereof with the vital heat which by means of the blood-vessels pervades all the substance of the body.
1. μεταβαλλούσης δε τής θερμότητος]

So far as the theory has yet been set forth, no reason has been assigned why the heated air escapes alternately through the respiratory passages and through the pores of the body; the wheel might always turn in the same direction. Plato now endeavours to supply a cause for this: but it must be confessed that, if I rightly apprehend his meaning, it is a very inadequate one: however it seems to be as follows. Let us suppose the process to be at this point, that the heated air in the έγκυρτα has just passed up through the trachea into the outer atmosphere; accordingly the cool stratum of air surrounding the body has passed in through the pores to supply its place. Now why should this newly entered air, when it in its turn is heated and endeavours to escape, return through the body instead of following its predecessor up the trachea? The reason assigned is this: the warm air on passing forth out of the mouth or nostrils finds itself plunged in the cool atmosphere without; at the same time the air newly arrived in the body is heated. The preponderance of warmth is now in the neighbourhood of the outlet through the flesh: the heated air therefore seeks the nearest and easiest way of escape by passing outward through the pores of the body, as it had entered; whereupon the περίωσις sends a current of air down the respiratory passages. Then precisely the same process takes place at the other entrance: the air that entered through the trachea is warmed, and likewise seeks to escape by the nearest outlet, viz. the trachea. Thus the air that passes into the body by either entrance is always impelled to return by that same entrance and not by the other. But this part of the theory is both obscure and unsatisfactory, unless some better interpretation of it can be found. Plato’s hypothesis, it will be observed, renders the process entirely independent of any muscular action of the body; and Galen’s criticism is pertinent: έν ουδέτερα δε αυτών ο Πλάτων προσχρήστη τή προαρθέσει, καλτοί φανερώς έν ήμιν ουτο και τό θάτον και βραδύτερον έλαστόν τε και πλέον και πυκνότερον εσπευσά τε και εκπευσά.

79 Α—80 Β, c. xxxvii. The same principle of circular impulsion will account for the action of cupping-glasses, for the process of swallowing, for the motion of projected bodies, whether through the air or along the ground, and for the consonance of high and deep notes, which is produced by the gradual retardation of the swifter sound until it coincides with the motion of the slower. To the same cause is due the flowing of water, the falling of the thunderbolt, and the force
is heated, but that which passes out is cooled. So the heat changes its position and the parts about the other outlet become warmer; therefore the heat now has a stronger tendency in the new direction, seeking its own affinity, and impels the air by the other passage: and this, undergoing the same change and reproducing the same process, is thus by these two impulses converted into a wheel swaying backwards and forwards, and so it gives rise to respiration.

XXXVII. In the same direction are we to look for the explanation of the phenomena of medical cupping-glasses and of swallowing and of projected bodies, whether cast through the air or moving along the ground; and of sounds too, which from their swiftness and slowness seem to us shrill or deep,

of attraction exercised by amber and the loadstone. All these diverse phenomena are due to the manifold interaction of these two principles—the absence of void, which is the cause of the circular impulsion, and the vibratory motion which causes every substance to strive towards its own peculiar region in space.

8. περὶ τᾶς λατρικᾶς συκώας] Plato now applies his two great dynamical principles to the explanation of various natural phenomena. He does not work out the mode of their operation in detail, but leaves that to be done by the reader. A full commentary on the present chapter will be found in Plutarch qvestiones platonicae vii. The explanation of the cupping instruments is this. When the cup is applied to the flesh, the air within it becomes warmed and consequently dilated; and escaping through the pores of the metal, it thrusts the surrounding air, which in its turn, pressing on the surface of the body, forces the humours to exude into the cup: cf. Timaeus Locris 102 Α.

9. τὰ τῆς καταπόσεως] The food, propelled downwards by the muscles of the throat, thrusts the air in front of it: this, escaping through the pores, thrusts the air outside, which by the περιλώσις presses upon the food from behind and pushes it downward: and since at every moment of its progress more air is displaced to set the περιλώσις in motion, the downward impulse is continually maintained.

τὰ τῶν μεταημένων] The process is the same here as in the preceding instance: if a stone is hurled through the air, the air displaced in front of the stone sets up a περιλώσις which impels it behind and keeps it going. The problem which seemed to the ancient thinkers to demand solution was, when the stone has left the hand of the thrower and consequently is no longer directly receiving any propulsion from it, what is it that keeps the stone moving? what enables it to withstand the force of gravitation which would otherwise cause it to fall perpendicularly earthward? A clear understanding of the point of view from which this question was regarded will be gained from Aristotle physiea viii x 266b 27 foll. Aristotle, who seems to adopt Plato’s explanation, remarks that the propelling hand communicates to the stone not only passive motion, but an active power of moving the air before it: it ceases to be κινούμενον at the moment it leaves the hand (relatively to the hand, Aristotle should have added), but remains κινούν so long as it is in motion.

11. καὶ ἐσοί φθόγγοι] It is not at
first obvious how the principle of περόωσις applies here. But I think it is clear that Plato does not mean the περόωσις to account for the consonance of different sounds, but only for their propagation from the sounding body to the ear. This is effected in exactly the same way as the projection of a stone through the air. Sound is produced by the vibration of a certain body of air, or of some other conducting medium: it is propagated by the transmission of this vibration, or rather, on Plato's theory, of this vibrating body of air through the atmosphere; for it, like the stone, displaces the air in front, which keeps perpetually rushing in and propelling it behind. This interpretation differs from that given by Plutarch quaestiones platonicae vii 9, which is, I think, unquestionably erroneous. He supposes the περόωσις to account for the consonance of high and deep notes, and explains it thus: the acuter sound, travelling faster than the deeper, strikes first upon the ear; then passing round by the περόωσις, but with gradually diminishing speed, it overtakes the slower, and assimilating its motion to that of the latter reaches the ear again along with it: οὖν σφόδρα καὶ συντόνως πληγεῖς προσμένει τῇ ἀκοῇ πρῶτος, ἐκα περιῶν πάλιν καὶ καταλαμβάνων τῶν βραδύτερων συνέπεται καὶ συμπαραπέμπει τὴν αὐθεντήν. But there are grave objections to be brought against this: (1) it is a totally illegitimate use of the περόωσις: it is as if a stone hurled in the air should describe a circular orbit; (2) Plutarch makes the swifter sound overtake the slower; but Plato distinctly speaks of the slower overtaking the swifter, when the latter is relaxing its speed. If however we suppose the περόωσις to be accountable merely for the transmission of the sounds, the explanation as above is quite plain and simple; and for the consonance it is not wanted. Compare Aristotle de auditibilibus 804a 4 foll.

2. τὰς γὰρ τῶν προτέρων] The cause of consonance, according to Plato, is this. If a high and a low note be sounded together, the high note, which travels more swiftly through the air, will reach the ear first and communicate its vibrations to it. Presently the deeper note arrives. But by that time the vibrations of the higher note, which have been gradually becoming slower, are synchronous with the vibrations added by the deeper note, and a consonance ensues. If the vibrations of the higher note have not slackened down to the speed of the lower, discord is the result instead of concord: thus if we strike simultaneously two notes at the interval of a semitone, a sharp discord is produced, because the two sounds
sometimes having no harmony in their movements owing to the irregularity of the vibrations they produce in us, sometimes being harmonious through regularity. For the slower sounds overtake the motions of the first and swifter sounds, when these are already beginning to die away and have become assimilated to the motions which the slower on their arrival impart to them: and on overtaking them they do not produce discord by the intrusion of an alien movement, but adding the commencement of a slower motion, which corresponds to that of the swifter now that the latter is beginning to cease, they form one harmonious sensation by the blending of shrill and deep. Thereby they afford pleasure to the foolish, but to the wise joy, through the imitation of the divine harmony which is given by mortal motions. And the flowing of all waters, the fall of thunderbolts, and the wonderful attracting power of

are so nearly of the same pitch that the lower reaches the ear before the higher has had time to slacken at all. It is evident from Plato's language that he conceived the acuter sound both to travel more swiftly through the air and to have more rapid vibrations: he thus comes very near the correct explanation of pitch, but falls into the not unnatural error of supposing that the more rapid vibration causes a swifter progress through the air. His theory of consonance is entirely unsatisfactory: apart from any other objection, the process he describes could only produce unison, not concord. For he cannot mean merely that the swifter vibrations slackened down so as to produce a due numerical ratio to the slower, since such a numerical ratio might have as well existed at first. It is strange that Plato, with his fondness for analogy, should not have based harmony of accords upon this. It will be observed that the principle of περίον is in no way concerned with the present hypothesis.

9. ἤδωνην μεν τοῖς ἀφροσιν] See note on 47 D. The ἔφροσιν enjoy music because they recognise that it is based on the same harmonic ratios as are found in the soul: in plainer language, because it expresses to the ear truths of the unseen world. For εὐφροσύνην compare Cratylus 419 D παντὶ γὰρ δῆλον ὡς ἀπὸ τοῦ εὖ ἑν τοῖς πράγμασιν τὴν ψυχήν εὐφροσύνην ἐξικόρισθαι τόσο καί ἔλαβε τὸ ὄνωμα, εὐφροσύνην. The word expresses a calm enjoyment, different from the undisciplined pleasure of the multitude, the ἀπειρο ἠδών beloved of Philebus.

11. τὰ τῶν ὑδάτων πάντα βεύματα] The cause of the flowing of water is pretty much the same as that alleged in 48 E for the flowing of molten metal, except that here we have to assume the original impulse, which there is explained. It seems strange that Plato makes no use here of the force of gravitation: perhaps that is assumed as obviously auxiliary; and this chapter is but an exceedingly brief summary.

τῶν κεραυνῶν πτώματα] The action in this instance is precisely identical with that in the case of the projection of a stone through the air.

12. τὰ βαμμαξάμενα ἐλέκτρων] The explanation given by Plutarch is as follows. Amber contains within it something φλογειδῆς ἀπὸ πνευματικῶν, a rare and
subtle substance, which is released by friction, the pores of the amber being expanded. This substance on escaping and coming into collision with the adjacent air sets up a perlwis: and the air impinging from behind drives before it any light object in the vicinity, until it reaches the electrified piece of amber. Theophrastos seems to confound amber with the loadstone: de lapidibus § 29 ἐπέλ de καὶ τὸ ἐλεκτρὸν λίθος...μάλατα δ’ ἐπιδήλος καὶ φανερωτάτη ἢ τὸν σίδηρον ἁγουσα.

1. τῶν Ἡρακλείων λίθων] This name is said to have been given to the loadstone from the town of Heraklea in Lydia. Plato’s theory of the magnet is very much the same as in the case of the amber. There stream off from the magnet large and heavy particles of air, which, in the perlwis that they occasion, themselves strike upon the iron and drive it towards the magnet. The reason why iron alone is so influenced is, according to Plutarch, that iron, being more dense than wood but less so than gold and other metals, has its pores of exactly the right size to retain the particles of air, which thus, instead of slipping off as they do in the case of other substances, propel the iron before them.

A peculiarity in this theory is that the air which escapes from the magnet itself is returned to it by the perlwis: this is necessitated by the fact that iron and nothing else is attracted, iron being amenable to that particular kind of air alone. It is possible however that Plutarch may not have exactly represented Plato’s meaning. On the subject of the loadstone compare Ion 533 δ’ ὅσπερ ἐν τῇ λίθῳ, ἣν Ἐορίπλος μὲν Μαγνῆτι ὁμόμασεν, οἱ δὲ πολλοὶ Ἡρακλεῖαν. καὶ γὰρ αὐτῇ ἣ λίθῳ οὐ μόνον αὐτὸς τοὺς δακτυλίους ἀγεί τοὺς σιδήρους, ἀλλὰ καὶ δύσμων ἐντίθησα τοὺς δακτυλίους, ῥωτ’ αὐτὸν ὅσπερ ἤ λίθῳ, ἄλλους ἄγει δακτυλίους, ῥωτ’ ἐνεστο ὡμαθός μακρός πάνω σιδήριων δακτυλίων ἐξ ἀλλήλων ἡρήται: πάσι δὲ τοῖς ἐξ ἐκείνης τῆς λίθῳ ἢ δύσμων ἀνήρηται. Compare also Lucretius vi 998—1064.

ν. τούς Ἡρακλείων λίθους] This is it is denial of ὁλη which Galen chiefy complains of in Plato’s physics: de plac. viii 708 ἀναρεῖ γὰρ ὅλην, ἣ πρὸς πολλὰ τῶν φυσικῶν ἔργων ὁ Ἰπποκράτης. χρήμα. διὰ τοῦτο ἦμαι γεγογκαθή τῶν ἑνεργειῶν ἐναὶ οὐκ ἄνευ τῆς ὅλης γενόμενα εἰς περίσσων ἀναφέρει.

3. τὸ τε διακρινόμενα] i.e. under the pressure of the πλησίος the various bodies
amber and of the loadstone—all these are due to no drawing power, but to two causes: first there is no void, and the atoms jostle one upon another; secondly when they are divided or contracted they change places and move severally towards their own region; and by the complication of such conditions all these wonders arise, as will be plain to him who examines them by the proper method.

XXXVIII. The process of respiration then, whence this discussion arose, rests on the principles and causes which have been set forth: fire divides the food, following the air as it sways up and down within; and through this oscillation it replenishes the veins from the belly by pumping into them from thence the comminuted food. In this way throughout the whole body of all animals the streams of nourishment are kept con-

are constantly changing their form and their appropriate region in space. The text can hardly be sound here.

5. τεθανατουργημένα] Owing to the endless complexity and intricacy of the interaction which these two forces exert upon one another, many of their effects appear to us marvellous, because we have not the means of tracing the conditions which gave rise to them. Compare Latus 893 D διό δὴ τῶν θεαμαστῶν ἀπάντων πηγὴ γέγονεν, ἀμα μεγάλοις καὶ σμικροῖς κύκλοις βραδυτήτας τε καὶ τάχης ὁμολογούμενα περεύομαι, ἀδόνατον ὡς ἐν τις ἐλπίσει γίνεσθαι πάθος.

80 D—81 E, c. xxxviii. Respiration then is subsidiary to digestion: the fire which accompanies the oscillation of the air comminutes the food, which is then pumped into the blood-vessels and distributed throughout the body. The nutriment, consisting as it does of different kinds of vegetables, has naturally a variety of hues; but the action of the fire reduces it all to a predominant red colour. Now the microcosm of the human body has its motions conformable to those of the great universe: the law that like seeks to like holds good of it also. So as the substance of our bodies is continually being dissolved and evaporated by the action of the external elements, the food that is assimilated by virtue of this natural law proceeds to replenish the void left by that which is lost: and the body increases or diminishes according as the replenishment exceeds or falls short of the waste. In a young child the substance of the body, though soft, has its triangles true and sharp: therefore they readily overpower and assimilate the blunter triangles of the nutriment; but as time goes on, the triangles are blunted and cannot so well subdue the others; whence is old age and decay. Finally when the triangles of the vital marrow can no more hold out, the bonds of the soul are loosed, and she flies away rejoicing: for though death which comes by wounds or sickness is painful, when it is the result of natural decay it is painless and brings pleasure rather than distress.

7. ὅθεν ὁ λόγος ὄρμησε] i.e. the exposition of the law of περισσος. Plato now passes from respiration to the processes of nutrition, growth, decay and death. It seems to me that κατὰ ταύτα is clearly to be preferred over κατὰ ταυτά for the sake of symmetry.

11. ἐπαντλεῖν] See above, 79 A.
trophēs námarta óuτως ἐπίρρυτα γέγονε. νεότητα δὲ καὶ ἀπὸ ἐξυγγενῶν ὄντα, τὰ μὲν καρπῶν, τὰ δὲ χλόης, ἀ θεος ἐπ' αὐτῷ ἐ τοῦθ ἡμῖν ἐφύτευσεν εἶναι τροφήν, παντοδαπα μὲν χρώματα ὅσχει διὰ τὴν ξύμμειξιν, ἡ δ' ἐρυθρὰ πλείστη περὶ αὐτὸ χρῶς διαθεῖ, τῆς τοῦ πυρὸς τομῆς τε καὶ ἐξομόρξεως ἐν ύγρῷ δεδημουργημένη φύσις: ὅθεν τοῦ κατὰ τὸ σάμα ρέοντος τὸ χρώμα ἐσχεν οίαν ὄψιν διηλιθάμεν. οὐ καλοῦμεν αἷμα, νομίζω σαρκῶν καὶ ξύμπαντος τοῦ σῶματος, ὅθεν ὑδρευόμενα ἔκαστα πληροὶ τῇ τοῦ κενομένου 81 Α. βάσιν. ὡς τρόπος τῆς πληρώσεως ἀποχωρήσεως τε γέγενται.

καθάπερ ἐν τῷ παντὶ παντὸς ἡ φορὰ γέγονεν, ἥν τὸ ἐξυγγενῆς πᾶν φέρεται πρὸς ἑαυτό. τὰ μὲν γὰρ δὴ περιεστῶτα ἐκτὸς ἡμᾶς τῆς τα ἀεὶ καὶ διανέμει πρὸς ἐκαστον εἴδος τὸ ὀμφύλον ἀποτέμπουντα, τὰ δὲ ἐναίμα αὐτ, κερματισθέντα ἐντὸς παρ' ἡμῖν καὶ περιεπλημμένα ὀστέρ υπ' οὐρανοῦ ἐνυπέρτως ἐκάστος τοῦ ζῶου, τῆς τοῦ παντὸς ἀναγκάζεται μιμεῖσθαι φοράν πρὸς τὸ ἐξυγγενῆς οὐν φερόμενον ἐκαστον τῶν ἐντὸς μερισθέντων τὸ κενωθὲν τὸτε πάλιν ἀνεπλήρωσεν. ὅταν μὲν δὴ πλέον τοῦ ἐπιρρέουντος ἀπήγ, φθίνει πᾶν, ὅταν δὲ ἑλαττον, αὐξάνεται. νέα μὲν οὐν ἐξόστασις

γέγονεν: γεγονέναι ΑΣΖ. τοῦ ἀποτέμπου: ἀποτέμπων ΑΣΖ. 81 τοῦ ἀποτέμπου: ἀποτέμπων ΑΣΖ. 15 τοῦ αὐτοῦ χρώματος αὐξάνει.
stantly supplied. And the particles of food, being freshly severed and from kindred substances—some from fruits and some from herbs, which God planted just to be our sustenance,—have all manner of colours owing to their intermixture; but a red hue pervades them most of all, through the natural contrivance whereby the fire divides the food and imprints its own hue upon it: whence the colour of the fluid that circulates through the body has the appearance we have described. This we call blood, which is the sustenance of the flesh and of all the body, and from which all parts draw moisture to fill up the places that are left void. And the mode of replenishment and evacuation is like the motion of all things in the universe, whereby all kindred substances seek each other. The elements that surround us without are constantly dissolving our substance and distributing it to its several kinds, returning each to its own kindred: and again the particles of blood, being minutely divided within us and enveloped in every creature by the body, as though by a heaven surrounding them, are forced to copy the universal motion. Therefore each of the divided particles within us is carried to its own kind and thus replenishes again what was left void. Now when the loss is greater than the replenishment, everything diminishes, but when less, it increases. The young

general meaning: but the exact part played respectively by the two principles of 'like seeks to like' and the περιώσις is not very clearly indicated.

11. τὰ μὲν γὰρ δὴ περιστάτα] The surrounding elements are conceived to have a solvent effect upon the body: they convert icosahedrons into octahedrons, and so forth. Consequently these particles, on changing their forms, change their natural homes, and flying off τῶν ὀμόφυλων, leave a deficiency in the substance of the body.

15. πρὸς τὸ ἔγγενες] i.e. the particles of the blood which are akin to those of any special portion of the body flow thither so soon as room is made for them by the efflux of any particles from that spot.

18. νέα μὲν οὖν ἔνστασι] Now follows the account of ἀείς and φθιας. When the human frame is still young, the particles of which it is composed, and especially those of the vital fire, have all their angles true and keen. The particles whereof the nutriment is formed are, on the contrary, comparatively blunt through age; hence the fiery particles have no difficulty in dividing them and performing the work described at 79 A. Consequently the food is very thoroughly assimilated and dispersed throughout the body, and the child grows apace. Notwithstanding the minute elaboration of this and several previous chapters, we read in Aristotle de gen. et corr. 1 ii 315a 29 Πλάτων μὲν οὖν μόνον περὶ γενεσίως ἐσκέφατο καὶ φθορᾶς, δέως ὑπάρχει τοῖς πράγμασι, καὶ περὶ γενεσίως οὐ πάσης, ἀλλὰ τῆς τῶν στοιχείων πᾶς οἷς σάρκες
τοῦ παντὸς ἔκθεμαν ἐστὶ ἐχοῦσα τῶν γενῶν, ἵσχυραν μὲν τὴν ξύγκλεισιν αὐτῶν πρὸς ἀλληλα κέκτηται, ξυμπέπηγε δὲ ὁ πᾶς ὅγκος αὐτῆς ἀπαλός, ἂτ' ἐκ μελείου ὁ μὲν νεωτί γεγονυῖα, τεθραμμένης δὲ ἐν γάλακτι, τὰ δὴ περιλαμβανόμενα ἐν αὐτῇ τρίγωνα ἔξωθεν ἐπεισεδόθοντα, ἔξ' ὧν ἂν ἡ τὰ τε στιὰ καὶ ποτα, τῶν ἐαυτῆς τριγώνων παλαιότερα δύνα ἀν ἀσθενέστερα καινοὶ ἐπικρατεῖ τέμνουσα, καὶ μέγα ἀπεργίζεται τὸ ξύδον τρέφουσα ἐκ πολλῶν ὁμοίων. ὅταν δὴ ἡ βίζα τῶν τριγώνων χαλὰ διὰ τὸ πολλοὺς ἄγωνας ἐν πολλῷ χρόνῳ πρὸς πολλὰ ἡγούμεθα, τὰ μὲν τῆς τροφῆς εἰσίν τοῦτο οὐκέτι δύναται τέμνειν ὅ εἰς ὁμοίωτα ἐαυτῶς, αὐτὰ δὲ ὑπὸ τῶν ἔξωθεν ἐπεισεδόθηντων εὑρέτως διαίρεται: φύνει δὴ πᾶν ξύδον ἐν τούτῳ κρατοῦμενον, γηράς τέ ὀνομάζεται τὸ πάθος. τέλος δὲ, ἐπειδὼς τῶν περὶ τὸν μελεύνῳ τριγώνων οἱ ἐνναρμοσθέντες μικρέτι ἀντέχοισι δεμοὶ τῷ πόιῳ διειστάμενοι, μεθαίσης τοὺς τῆς ψυχῆς αὐτὶς ἄσις, ἡ δὲ λυθείσα κατὰ φύσιν μεθ' ἱδρύης ἔξεπτατο. πᾶν γὰρ τὸ μὲν παρὰ φύσιν ἐν ἀλγείῳ, τὸ δ' ἡ πέφυκε γηγοῦμενον ἡδὺ· καὶ θάνατος δὴ κατὰ ταῦτα ὁ μὲν κατὰ νόσους καὶ ὑπὸ τριμακτῶν γηγοῦμενος αἰλωνίῳ καὶ βίαιος, ὁ δὲ μετὰ γῆρως ἑώς ἐπὶ τέλος κατὰ φύσιν ἀπονότατος τὸν θανάτων καὶ μᾶλλον μεθ' ἱδρύης γηγοῦμενος ἡνικῆς.

5 ἐς αὐτῆ: ἐαυτῆ Ἀ.  ὦ αὐτῆ Ἀ. 3. διειστάμενοι: διειστάμενοι Ἀ. διεισταμένοι HSZ. 19 γῆρως: γῆρας SZ.

I conceive βία to mean the fundamental structure of the triangles: the outlines composing it, its sides and angles, from long wear and tear, are no longer so true in form as once they were.

10. τὰ μὲν τῆς τροφῆς] Compare Hippocrates de prisci medicina vol. i p. 27 Kühn ὅσα μὲν ἰσχυρότερα ἡ οὐ δυνάμεται κρατεῖν ἡ φύσις, ἡν ἐσβάλλειται, ἀπὸ τούτων δ' αὐτῶν πάνως καὶ νόσους καὶ θανάτων ἑορτάζον ὅσων δ' ἦν δύναται ἐπικρατεῖν, ἀπὸ τούτων τροφῆν τε καὶ ἀδέσποτην καὶ υγείην.

11. αὐτὰ δὲ ὑπὸ τῶν ἔξωθεν] Instead of dividing and assimilating the particles of the food, the particles of the body are themselves divided; and the constitution being thus generally enfeebled, the condition ensues which we call old age. Plato has not expressly distinguished be-
 TIMAIOS.

frame then of the entire creature, having the triangles of its elements still as if fresh from the workshop, has them firmly linked one to another; but the whole mass is soft in substance, seeing that it has been newly formed out of marrow and nurtured upon milk. Now forasmuch as the triangles of the substances composing the food and drink, which enter from without and are received within the young creature, are older and feeble than those of the latter, it divides and subdues them with its new triangles, and by the assimilation of a large number nourishes and increases the animal: but when the exact outline of the triangles is blunted, because they have been for a long time struggling with many others, they are not able as of old to comminate and assimilate the entering aliment, but are themselves easily divided by the incoming particles. At such a time every living thing is enfeebled and wastes away; and this condition is termed old age. Finally when the bonds of the triangles belonging to the marrow no longer hold to their fastenings but snap asunder with the stress, they loose in their turn the bonds of the soul; and she, being in the course of nature released, flies away with gladness. For all that is contrary to nature is painful; but whatsoever takes place in the natural way is pleasant. On the same principle death which ensues upon sickness or wounds is painful and violent; but that which draws to the natural end in the course of old age is of all deaths the least distressing and is accompanied rather by pleasure than by pain.

between the fiery particles, which do the work of digestion, and those which enter into the composition of the body at large. We must suppose that when the pyramids of the vital fire become too much blunted to perform their duty properly, the incoming aliment makes war upon and weakens the general structure of the body.

14. μηκέτι ἀντέχωσι δεσμοί] Finally, when the triangles of the marrow itself become blunted, the bonds of the soul are loosed, and she flies forth with joy: or translating into plain prose, the brain and spinal marrow become no longer a fit medium for the soul to act upon. For δεσμοί see 73 D.

15. διστάμενοι] The form διεστάμενοι, adopted by the more recent editors from A, seems to me very suspicious. The only parallel quoted, so far as I can find, is κατεστέαται in Herodotus i 196, where there is a variant κατεστάται, which Abich reads. Altogether the word appears to need more support than it has yet received.

16. κατὰ φύσιν] The doctrine that death in the course of nature is painless, if not pleasurable, is conformable to Plato's general theory of pleasure and pain. Pain is the result of a condition which is παρὰ φύσιν: therefore death, which is κατὰ φύσιν, cannot be painful.

20—2
XXXIX. To δὲ τῶν νόσων ὅθεν ἔξωσταται, δηλοῦν ποι καὶ παντὶ. τεττάρων γὰρ ὄντων γενόν, εἴ ὅν συμπέπηγε τὸ σῶμα. 82 ἀγῆς πυρός ὑδατός τε καὶ ἀέρος, τοῦτον ἢ παρὰ φύσιν πλεονεξία καὶ ἐνδεια καὶ τῆς χώρας μετάστασις εἴς οἰκείας ἐπ᾽ ἀλλοτρίαν γυγμομένη, πυρός τε ἀν καὶ τῶν ἐτέρων ἐπειδή γένη πλεονα ἕνε ὄντα τυγχάνει, τὸ μὴ προσήκων ἐκαστὸν ἐαντῷ προσλαμβάνειν καὶ πάνθ᾽ ὅσα τοιαύτα στάσεις καὶ νόσους παρέχειν παρὰ φύσιν γαρ ἐκαστον γυγμομένου καὶ μεθισταμένου θερμαίνεται μὲν ὅσα ἀν πρότερον ψύχηται, ξηρὰ δὲ ὄντα εἰς ἑστερον γίγνεται νοσερά, Β καὶ κοῦφα δὴ καὶ βαρέα, καὶ πάσας πάντως μεταβολὰς δέχεται. 

μῶνς γὰρ δὴ, φαμέν, ταῦταν ταῦτα κατὰ ταῦτα καὶ ὁσαίτως καὶ ἀνὰ λόγον προσγυμνόμενον καὶ ἀπογυμνόμενον ἐισέ ταῦταν ὅν αὐτῷ σῶν καὶ υγίεις μένειν ὅ δ᾽ ἀν πλημμελήσῃ τι τοῦτων ἐκτὸς ἀπίον ἢ προσίον, ἀλλοιόττατα παμποκιλὰς καὶ νόσους 

15 φθοράς τε ἀπείρους παρέχεται. δευτέρων δὴ ἦς ἀυστάσεων ἀν κατὰ

81 E—84 C, c. xxxix. A classification of diseases now follows. These arise (1) from excess or deficiency of any of the primary substances of which the body is formed, viz. fire air water and earth; this causes disturbance of the natural conditions and consequently pain and sickness: (2) from disorder in the secondary structures of the body and reversal of their natural relations. For naturally the blood feeds the flesh, and the flesh secretes a fluid which nourishes the bones and marrow: but in disease the flesh degenerates and dissolves into the blood, forming bile of divers kinds and phlegm. But if the evil affects the flesh alone, the danger is not so great; more serious is it when the cement which unites the flesh to the bones is attacked; for then the very roots of the flesh are severed, and it is loosed from the bones and tendons. Yet graver is the case when the mischief seizes upon the bones themselves; but most deadly of all, if the malady is in the marrow; for then the whole course of the body’s nature is reversed from the very beginning.

2. τεττάρων] Plato distinguishes between the primary and the secondary structures of the body. The first are simply the fire air earth and water where- of it is composed: the second are structures formed out of these; blood, flesh, tendons, bone, and marrow. The maladies arising from disorders of the first class are not here specified; but in 86 A we have continued and intermittent fevers referred hereto; and probably most minor ailments would be assigned to this cause. These πρώται ἔξωστασεις are termed in the Timaeus Locrus 102 C ταὶ ἀπλαὶ δυνάμεις, θερμάτας ἢ ψυχράτας ἢ ὑγράτας ἢ ἄγρατα.

5. πυρὸς τε ἀν καὶ τῶν ἐτέρων] Stallbaum, joining these words with the preceding, gives a very unsatisfactory account of this passage. There is no difficulty in it, if we expunge the comma which he places after ἐτέρων and take the genitives after γένος. Plato is giving two causes of sickness; the first is the excess or defect or unnatural situation of some element; the second (introduced by ἀν) is that, whereas diverse kinds exist of each element (cf. 57 C), the wrong sort is
XXXIX. Now the cause whence sicknesses arise is doubtless evident to all. For seeing there are four elements of which the body is composed, earth fire water and air, any unnatural excess or defect of these or change of position from their own to an alien region, and also—since there are more than one kind of fire and the other elements—the reception by each of an unfitting kind, and other such causes, all combine to produce discord and disease. For when any of them changes its nature and position, the parts that formerly were cool are heated, and those that were dry become afterwards moist, and the light become heavy, and all undergo every kind of change. The only way we allow in which one and the same substance can remain whole and unchanged and sound is that the same element should be added to it or taken away from it on the same principle and in the same manner and proportion; and whatsoever errs in any of these points in its outgoings or incoming causes a vast diversity of vicissitudes and diseases and destructions. Next in the secondary structures which are in a present. The subject of παρέχει is the sentence τὸ μὴ προσήκον...τοιαῦτα.

7. στάσεις καὶ νόσους] Compare Sophist 238 οὐκ ἅπας καὶ στάσις οὐ ταὐτῶν νενόμικας.

8. θερμαίνουσι τέλει] Compare Hippocrates de natura hominis vol. I p. 350 Kühn πολλὰ γὰρ εἶσιν ἐν τῷ σώματι ἑών, ἀ ὅκοταν ὅτι ἄλλη ἀληθεία παρὰ φύσιν θερμαίνουσι τε καὶ ψύχηται, καὶ ἐξαρπανταὶ τε καὶ ὑγραίνουσι, νόσους τίκτει. This refers, as appears a little further on, to the four vital fluids enumerated by Hippocrates p. 352 τὸ δὲ σῶμα τοῦ ἀνθρώπου ἔχει ἐν ἑαυτῷ αἷμα καὶ φλέγμα καὶ χολὴν διστήν, ἡγοῦν ἐκαθήν τε καὶ μελαναν, καὶ ταῦτ' ἔστιν αὐτέρις ἡ φύσις τοῦ σώματος, καὶ διὰ ταῦτα ἄλγεις καὶ υγιαίνει, ὑγιαίνει μέν ὑπὸ μᾶλλον, ὅκοταν μετρίως ἔχῃ ταῦτα τῆς πρὸς ἄλλη ἀλήθεια κρίσεις καὶ δυνάμους καὶ τοῦ πληθεῖος, καὶ μάλιστα ἕνε μεμαυγεῖτα ἕν ἄλγεις δὲ, ὅκοταν τις τοὐτῶν ἐλασσὸν ἢ πλέον ἢ, ἢ χωρίσθη ἐν τῷ σώματι καὶ μὴ κεκρημνένον ἢ τοίοι ἑξήμασι. This statement of Hippocrates is approved by Galen as more correct than Plato's, de plac. Hipp. et Plat. VIII 677, 678. Compare a statement attributed to Alcmia by Stobaeus florilegium 100 λέγει δὲ τὰς νόσους συμπίπτειν, ἃς μὲν ὑφ' οὗ, δι' ὑπερβολὴν θερμοτητὸς ἢ ἔξοχοτητὸς, ὃς δὲ ἐξ οὗ, διὰ πλῆθος προφήτη ἢ ἐνδικα, ὃς δὲ ἐν οἷς, αἷμα ἢ μυελὸν ἢ ἐγκέφαλον: and again 101 'Αλκμαιαν ἐβη τῆς μὲν υγείας ἐσαι ἐφεκτικὴν τὴν ἱσοφυλίαν τῶν δυνάμων ὑγροῦ ἐξηροῦ ψυχροῦ θερμοῦ πικροῦ γλυκέος καὶ τῶν λωτῶν· τὴν δ' ἐν αὐτοῖς μοναρχιῶν νόσοις παρασκευαστικὴν ἐσαι.

11. μόνως ἀπο δή] i.e. each several part must have a continuous and unchanging supply in due proportion of the elements which contribute to its substance.

15. δευτέρων δή εὐστάσεων] The δευτέραι εὐστάσεις are the various όμοιομερή, in Aristotelian terminology, of which the body is constructed; blood, flesh, bones &c. Galen de plac. VIII 680 is wrong in blaming Plato for making blood a δευτέρα εὐστάσεις, since his πρώτα
The text in the image contains a fragment from Plato's dialogue on the nature of elements and their composition. The passage discusses the distinction between different forms of matter, such as air and water, and how they relate to the vital processes of the body. The text also touches on the distinction between natural and artificial processes, and how they affect the body's health.

Some key points from the passage:
- The distinction between different forms of matter.
- The role of air and water in the body's processes.
- The importance of natural processes over artificial ones.
- The concept of degeneration and liquefaction in the blood.

The passage is written in a philosophical style, with a focus on the natural processes of the body and how they are distinguished from artificial ones. The text is rich in scientific terminology, particularly in the context of the time, and the author's goal is to provide a clear and concise explanation of the natural processes that govern the body.
natural state of union a second class of diseases may be discerned by one who would scrutinise them. For whereas marrow and bone and flesh and sinew are composed of the four elements, and blood is formed of the same though in a different way, most of the diseases arise in the manner before explained, but the gravest afflict them with especial severity in the following way: that is to say, when the order of their generation is reversed, these structures are then destroyed. For in the course of nature flesh and sinews arise from blood, the sinews from the fibrine, owing to their affinity; the flesh from the clots which are formed when the fibrine is separated. From the sinews and flesh again proceeds a glutinous and oily fluid, which not only cements the flesh to the structure of the bones and itself gives nourishment and growth to the bone which encloses the marrow, but also so much of it as filters through the dense substance of the bones, being formed of the purest and smoothest and most slippery kind of the triangles, as it distils and oozes from the bones, irrigates the marrow. When these structures are produced in this order, health is the result as a rule; but when this is reversed, sickness ensues. For when the flesh decomposes and returns the deliquescent matter to the veins, then is mingled with air in the veins much blood of manifold kinds, with diverse hues and bitter qualities, as well as acid and saline

them to the earthy element in mud.

9. δ’ πηγνυται χαρισμένον [λυών] This is a curious statement: he conceives the flesh to be formed by the concretion of what is left of this blood after the ἰσες have gone to form νεφρα.

10. γίλακρον καὶ λιπαρόν] This glutinous and oily secretion of the flesh and tendons is perhaps identical with the synovial fluid, which lubricates the joints. Plato supposes it to form by coagulation the periosteum, or membrane enclosing the bones, and therefore to cement together flesh and bones: it also penetrates the bony envelope of the spinal column and nourishes the vital marrow, as well as the bones which protect it.

12. τὸ δ’ αὐτο ἀμα μὲν: while part of the oily fluid is employed as above, another part, the finest and smoothest, filters through to the marrow.

17. μετὰ πνεύματος αὖμ] This indicates that Plato regarded the veins as ducts for air as well as blood. Aristotle also held that air passed through the blood-vessels: see historia animalium i xvii 496a 30 εἴτε δ’ ἐστιν οἱ ἀνα τῆς καρδίας πόροι: ουδείς δ’ εστὶ κοινὸς πόρος, ἀλλὰ διὰ τῆς σύνασφυν δέχονται τὸ πνεῦμα καὶ τῆς καρδίας διατέμπους. The word πόρος is elsewhere applied by Aristotle to a nerve; but here he is clearly speaking of a blood-vessel. It was supposed by some authorities after his time that the arteries, as distinguished from the veins, were filled with air alone: see Cicero de natura deorum § 138 coque modo ex his partibus et sanguis per venas in omne co-
Plato uses the word ‘arteria’ in the modern sense.

1. χολᾶς καὶ ἵχώρας καὶ φλέγματα] The decomposition of the flesh produces bile and serum and phlegm. By χολᾶς we must understand morbid conditions or excessive abundance of that fluid: since in 71 b, c Plato expressly recognises that χολῆ is a normal and necessary constituent of the body; which is more than Aristotle did: cf. de partibus animalium iv ii 67b 31, 67b 11—32. The same applies to ἵχώρας, viz. that an abnormal condition is to be understood.

2. παλιναίρετα] i.e. ἀνάταλω τὴν γένεσιν ἐξοντα.

5. τὰξιν τῶν κατὰ φύσιν] Although Plato was of course ignorant concerning the circulation of the blood, he conceived it to have regular periodic motions.

6. μηδείμαν ἰαυτών ἀπόλαυσιν] i.e. they do not contribute to each other’s nourishment.

9. δύσπεπτον] Being old firm flesh, it yields reluctantly to the decomposing agent.

μελαίνει μὲν] i.e. it is blackened by long-standing inflammation and corrosion. The degeneration of flesh produces a morbid kind of χολῆ; of which are enumerated four classes, (1) black,
properties; and this contains all kinds of bile and serum and phlegm. For as all these are going the wrong way and have become corrupt, first they ruin the blood itself, and furnishing no nutriment to the body rush in all directions through the veins, paying no heed to the periods appointed by nature, but at war one with another, because they have no good of each other; at war also with all that is established and fixed in the body, which they corrupt and dissolve. Now when the oldest part of the flesh is decomposed, being hard to soften, it turns black through long-continued burning, and through being everywhere corroded it is bitter and dangerous to whatever part of the body it attacks which is not yet corrupted. Sometimes this black sort is acid instead of bitter, when the bitterness is more refined away; and again the bitter sort being steeped in blood gains a redder hue; and when black is mingled with this, it is greenish: sometimes too a yellow colour is added to the bitterness, when new flesh is decomposed by the fire of the inflammation. To all these symptoms the general name of bile has been given, either by physicians, or by some one who in looking at many dissimilar appearances was able to see one universal quality pervading them all which deserved a name. All other kinds of bile which are reckoned have their several descriptions according to their colour. Of lymph, one kind is the mild serum of blood,—the other is an acrid secretion of black and acid bile, when that is blended through inflammation with a saline property: this kind is called acid phlegm. But that

either bitter or acid, produced by the degeneration of old flesh, (2) reddish, where there is an admixture of blood, (3) green, apparently a combination of the two former, (4) yellow, from the corrosion of newly-formed flesh.

15. χλωώδες] This reading is clearly right: when Plato is classifying χολή according to colour, it were absurd to call one class χλωώδες. It will be remembered too that at 68 C green is derived from a mixture of red and black. χλωώδες is found in one ms. and the margin of another, and is also confirmed by Galen.

16. τού περὶ τὴν φλόγα πυρός] If φλόγα is right it must signify 'the inflammation'; but it is curiously abrupt, and I am disposed to agree with Lindau in suspecting it to be corrupt, though I cannot approve of his suggested alteration.

17. καλ τὸ μὲν κοινὸν ὄνομα] All these different forms have received the general name of χολή, bestowed either by medical men (and presumably somewhat at hap-hazard), or more scientifically by a philosopher skilled in discerning ἐν ἐπὶ πολλοῖς. Compare 68 D.

23. καλεῖται δὲ ὧνοι φλέγμα] Of
flēγμα two sorts are distinguished, ἐξ and λευκὸν. The first is the serum of μέλαια χολή, and a morbid humour: the second, formed by the dissolution of newly formed flesh and highly aerated, is in its normal state a natural and healthy secretion, viz. perspiration or tears; but if produced to excess, it is a source of disease.

1. ἐκ νέας καὶ ἀπαλῆς σαρκός] Galen, while approving Plato’s description of φλέγμα, dissents from his account of its origin: see de plac. viii 699 τὸ δὲ ἐκ συντηξεως ἀπαλῆς σαρκός γενέσα τὸ φλέγμα τῶν ἀποσωτάτων ἐστὶ: his own statement is δέδεκται γὰρ ἡ γε τοῦ φλέγματος γένεσις ἐκ τροφῆς φύσει ψυχροτέρας ἐνδεῶς ὑπὸ τῆς ἐμφύσου θερμασίας κατεργασθείσης ἀποτελομυένη.

2. ξυμπεριλθηθέντος ὑπὸ ύγρότητος] This seems to be a loose way of expressing that the air-bubbles are enclosed in the moisture of the φλέγμα.

9. τὸ καθ’ ἡμέραν i.e. in the normal healthy course of life.

11. ἄλλ’ ἐξ ἐναντίων] i.e. when it feeds upon the flesh or other structures of the body, instead of the food: see above, 82 ε.

13. μενοῦντος δὲ τῶν πυθμένων] That is, if the mischief is comparatively superficial, and the fundamental structure of the flesh is unhurt, recovery is still easy.

15. τὸ δὲ δὴ σάρκας ὀστῶις ἐξυδοῦν] sc. the γλάσχων καὶ λευκῶν, which by coagulation forms the periosteum, as ex-
which is formed in conjunction with air by the liquefaction of new and tender flesh,—when it is inflated with air enveloped by moisture, and through this condition bubbles are formed, invisible separately because of their smallness, but all together becoming visible in the mass and presenting a white colour to view by the formation of froth—this liquefaction of tender flesh in combination with air we term white phlegm. And the serum of freshly formed phlegm is sweat and tears, and whatever other secretions purify the body from day to day. All these become a means of disease, when the blood is not replenished from the food and drink in the natural way, but receives its volume in the contrary manner in despite of nature’s laws. Now when the flesh is anywhere pierced by disease, but the foundations of it remain intact, the malady has only half its power; for there is still the prospect of ready recovery. But when that which unites the flesh to the bones is diseased, and in turn no longer by distilling both from the fibres and sinews nourishes the bones and cements the flesh to them, but instead of being oily and smooth and glutinous becomes harsh and saline and shrivelled through an unhealthy habit of life, under these conditions all that substance crumbles away under the flesh and the sinews and separates from the bones; while the flesh, falling away from its foundations, leaves the sinews

Plained in 82 D.

16. αὐτὸ ἐξ ἐνὸν ἁμα] The reading of the mss. seems here unquestionably corrupt. The passage obviously refers to the substance mentioned immediately above, the cement which joins flesh and bones together. But this substance is not blood, nor is the blood ἐξ ἐνὸν καὶ νεμέον ἀποχώριζομενον; which the cement however is, provided we understand ἐνὸν here as signifying the fibrine of the flesh, not of the blood: see note on 82 D. It is plain then that ἁμα is wrong; and Lindau’s suggestion ἁμα seems to me a good one. But furthermore αὐ τὸ surely cannot be right; for αὐ introduces an antithesis where none exists, and the article seems to mark the mention of some new substance, whereas Plato is still speaking of the cement of flesh and bones. I have therefore made the slight alteration to αὐτό, which may, I think, be justified as setting off the fluid against the bones which it nourishes and the flesh which it fastens to them: it is itself no longer secreted and it therefore fails to nourish the bones and cement the flesh:

cf. 82 Ε τὸ τε ἁμα αὐτὸ πρῶτον διάλυσι, καὶ αὐτά αὐθέντα τροφὴν ἐτι τῷ σώματι παρέχουσα φέρεται.

19. καταψήχεται μὲν αὐτό] The periosteum dries up and crumbles, and the flesh, no longer cemented to the bones, falls away from them: cf. Aristotle historia animalium III xiii 519β 5 ψηλομένα τε τὰ ὀστά τῶν ῥιένων σφακίλτει.

21. ἐκ τῶν βίζων] The βίζα are the πυθμένες mentioned above in 83 E.
καταλείπουσι καὶ μεστὰ ἅλμης, αὐτάλ δὲ πάλιν εἰς τὴν αἷματος
φορᾶν ἐμπεσοῦσα τὰ πρόσθεν ῥηθέντα νοσήματα πλείω ποιοῦσι.
χαλεπῶν δὲ τούτων περὶ τὰ σώματα παθημάτων γγωνομένων μείζω
ἐτι γίγνεται τὰ πρὸ τούτων, όταν ὅστοι διὰ τυξκότητα σαρκός
άναπτον ὁμή λαμβάνων ἰκανίν, ὑπευρέτως θερμαινόμενον, σφακέ-
λίσαν μήτε τὴν τροφήν καταδέχονται πάλιν τε αὐτὸ εἰς ἐκεῖνην
ἐναντίον ἡ γνηκόμενον, ἡ δ' εἰς σάρκας, σάρξ δὲ εἰς αἷμα ἐμπτι-
πτουσά τραχύτερα πάντα τῶν πρόσθεν τὰ νοσήματα ἀπεργαζό-
ται, τὸ δ' ἐσχατὸν πάντων, ὅταν ἢ τοῦ μυελοῦ φύσις ἀπ' ἐνθείας ἢ
τινος ὑπερβολῆς νοσής, τὰ μέγιστα καὶ κυριότατα πρὸς θάνατον τῶν
νοσήματων ἀποτελεῖ, πάσης ἀνάπαυλας τῆς τοῦ σώματος φύσεως
ἐξ ἀνάγκης ῶνείσης.

XL. Τρίτον δ' αὖ νοσημάτων εἰδος τριχή δεὶ διανοεῖοις
γιγνομένου, τὸ μὲν ὑπὸ πνεύματος, τὸ δ' φλέγματος, τὸ δ' χολῆς. ὃ
ὅταν μὲν γὰρ ὁ τῶν πνευμάτων τὸ σώματι ταμίας πλεύμων μὴ
cαθαρᾶς παρέχῃ τὰς διεξόδους ὑπὸ πνευμάτων φρακταῖς, ἐνθα μὲν
οίκ ἐνα, ἐνθὰ δὲ πλείον ἢ τὸ προσήκον πνεύμα εἰς ὅλα τὰ μὲν οὕ
τυγχάνοντα ἀναψυχής σήπει, τὰ δὲ τῶν φλεβῶν διαβιαζόμενον
καὶ ξυνεπιστρέφουν αὐτὰ τῆκον το εἰς τὸ σώμα εἰς τὸ μέσον αὐτοῦ
διάφραγμά τ' ἱσχον ἐναπολαμβάνεται, καὶ μυρία δὴ νοσήματα

2. τὰ πρόσθεν ῥηθέντα νοσήματα] sc. the χολαί and φλέγματα.
4. τὰ πρὸ τούτων] i.e. when the degeneration begins further back; the bones
being regarded as posterior in the order of γένεσις to the flesh.

διὰ τυξκότητα σαρκός] Perhaps then, after all, if the gods had given our
heads a thick covering of flesh, we might
not have lived any the longer for it.
5. ἀναπνοή] cf. 85 A, c: 'ventilation'
seems to be the meaning here.
6. τὴν τροφήν] i.e. the oily fluid
which nourishes them. The bones de-
compose and mingle with this fluid, the
fluid with the flesh, and the flesh with the blood.

11. πάσης ἀνάπαυλ] The μυελός is
the very citadel of life; so that when the
disease assails that, the foundations of
health are sapped: the course of nature
flows backward from its utmost fount.

84 c—86 a, c. xl. A third class of
maladies remains for consideration: those
engendered by air, by phlegm, and by
bile. When an excessive amount of air
passes into the veins and penetrating
their sides finds its way into the flesh
and is there imprisoned, various evil re-
results follow; in some cases convulsions
and tetanus, which will hardly yield to
treatment, and diseases of the lungs. By
phlegm are produced leprosies and all
manner of skin-diseases; and when in
conjunction with bile it attacks the head,
epilepsy ensues, which is called the 'sacred
disease', because it affects the divinest
part. All kinds of inflammatory dis-
orders, accompanied by pustules and
eruptions, arise from bile; which also
bore and full of brine, and itself falling back into the current of
the blood aggravates the diseases that have been described. But
distressing as are these symptoms which affect the body,
yet more serious are those which are prior in order; when the
bones, owing to denseness of the flesh, cannot get sufficient air
and becoming mouldy and heated decay away, and while they
will not receive their nourishment, crumble down and return by
a reversed process into their nourishing fluid, and that in its turn
passing into flesh, and the flesh into blood, they render all the
diseases more virulent than those already mentioned. The most
desperate case of all is when the substance of the marrow be-
comes diseased by any defect or excess: this produces the most
serious and fatal disorders, seeing that the whole nature of the
body is forced to proceed in a backward course.

XL. A third class of diseases we must conceive as occurring
in three ways: one by the agency of air, the second of phlegm,
the third of bile. For when the lungs, which are the dispensers
of air to the body, do not keep their passages clear, because
they are impeded by catarrhs, the air, failing to pass through
some, and in others entering with a volume unduly great, causes
the decomposition of the parts which lack their supply of air,
and forces its way through the channels of the veins and dis-
locates them, and dissolving the body it is confined amid its
substance, occupying the midriff; and so countless painful
diseases are produced from these causes, accompanied by

seizes upon the fibrine of the blood, and
preventing its due circulation causes chills
and shuddering; and sometimes penetra-
ting to the vital marrow sets free the
soul: but if its fury be less violent,
it gives rise to diarrhoea and dysen-
tery. Continuous, quotidian, tertian, and
quarten fevers are caused by a super-
abundance of fire, air, water, and earth
respectively predominating in the com-
position of the body.

14. τὸ μὲν ὑπὸ πνεύματος] This class
of diseases is distinct from those caused
by a mere superfluity of air entering into
the composition of the body. We are at
present concerned with the maladies arising from the confinement of large
quantities of air in places where it has no
right to be.

18. τὰ δὲ τῶν φλεβῶν] Here again the
veins are considered as passages for air:
the ingress of air is normal; it is the ex-
cessive amount which gives rise to dis-
ease: see note on 82 E.

19. εἰς τὸ μὲνον αὐτοῦ] These words
are best taken with ἐναπολαμβάνεια.
But the sentence does not run smoothly,
and I suspect that something has gone
amiss with it. διάφραγμα ἐνχο, if the
words are sound, means taking posses-
sion of the midriff, pressing against it.
ἐκ τούτων ἀλγεων μετὰ πλήθους ἱδρώτως ἀπείρησται. πολλάκις δὲ ἐν τῷ σώματι διακριθεὶσας σαρκὸς πνεῦμα ἐγγενόμενον καὶ ἀδυνατοῦ ἐξώ πορευθῆκαι τὰς αὐτὰς τοὺς ἐπεισεληνυθῶσιν ἁδύνας παρέσχε, μεγάτας δὲ, όταν περὶ τὰ νεῦρα καὶ τὰ ταῦτα φλέβια 5 περιστὰν καὶ ἀνοιδήσαν τοὺς τε ἑπιτόνους καὶ τὰ ἕως ἱδρῶσα νεῦρα οὕτως εἰς τὸ ἐξόπισθεν κατατείνη τούτως: ἀ δὴ καὶ ἀπ’ αὐτοῦ τῆς συντονίας τοῦ παθήματος τὰ νοσήματα τέταιοι τε καὶ ὁπισθότονοι προσερρήθησαν. ὄν καὶ τὸ φάρμακον χαλεπτὸν πυρετοὶ γὰρ οὐν δὴ τὰ τοιαύτα ἐγγυνύμενοι μάλιστα λύσει. τὸ δὲ λευκὸν φλέγμα 85 Α 10 διὰ τὸ τῶν πομφολύγων πνεῦμα χαλεπτὸν ἀποληθῆνεν, ἕξω δὲ τοῦ σώματος ἀναπνοῖς ἵσχυον, ἦπιωτέρον μὲν, καταποικίλλει δὲ τὸ σῶμα λευκὰς ἄλφους τε καὶ τὰ τούτων ἀγγειευμένη νοσήματα ἀποτίκτων μετὰ χολῆς δὲ μελαίνης κερασθέν ἐπὶ τὰς περιόδους τε τὰς ἐν τῇ κεφαλῇ θεοτάτας οὕσας ἐπισκεδαιμνύμενον καὶ ξυιναράττουν 15 αὐτῶς, καθ’ ὑπνοῦ μὲν ἰὸν προάτερον, ἐγρηγορότι δὲ ἐπιτιθέμενον β δυσαπαλλακτότερον νόσημα δὲ ἱερᾶς δὲ φύσεως ἐνδικώτατα ἱερὸν λέγεται. φλέγμα δ’ ὦτῳ καὶ ἀλμυρὸν πηγὴ πάντων νοσημάτων, ὦσα γίνεται καταρροίκα διὰ δὲ τοὺς τόπους, εἰς οūς ἰῆ, πανοδαποὺς οὕτας παντοῖα νόμομα εἰλήφειν. ὦσα δὲ φλεγμαίνειν

1 πολλάκις post ἱδρώτως inserunt AS.

9 ἐγγυνύμενοι: ἐπιγιγνόμενοι S.

1. μετὰ πλήθους ἱδρώτως Plato evidently has in view consumption and kindred maladies.

2. διακριθεὶσας σαρκὸς In the former case the air entered from without: an equally bad, though different, result is produced when the imprisoned air has been produced within the body by dissolution of the flesh.

3. τοὺς τε ἑπιτόνους The ἑπιτόνοι are the great tendons of the shoulders and arms.

7. τέτανοι τε καὶ ὀπισθότονοι] The first is the generic term for diseases the symptoms of which are spasmodic contraction of the muscles: ὀπισθότονοι was a special form in which the muscles are drawn violently backwards: see Hippokrates de morbis vol. 11 p. 303 Kühn: the opposite form was ἐμπροσθότονοι. Aristotle also attributes these disorders to the action of air: meteorologica 11 viii 366b 25 οἱ τε γὰρ τέτανοι καὶ οἱ σπασμοὶ πνεῦματος μὲν εἰσὶ κινῆσεις.

8. πυρετοὶ γὰρ οὖν δὴ] Compare Hippokrates aphorisms vol. III p. 735 Kühn ὑπὸ σπασμὸν ἢ τετάνον ἐνοχλομένῳ πυρετὸς ἐπιγιγνόμενοι λέει τὸ νόσημα. Plato means that in cases which do not end fatally it is this natural relief, rather than medical treatment, which saves the patient’s life.

10. διὰ τὸ τῶν πομφολύγων πνεῦμα] The diseases produced by the λευκὸν φλέγμα are ultimately to be traced to πνεῦμα, since they are due to the air which is enclosed in the former: they are less dangerous however, because they are thrown off at the surface.

12. λέυκας ἄλφους τε] These are diseases of the skin described by Celsus v xxviii 19.

15. καθ’ ὑπνοῦ μὲν ἰὸν προάτερον] ‘In many epileptics the fits occur during the
excessive sweat. Often too when the flesh is broken up, air is formed in the body, and being unable to find an exit it produces the same torments as are caused by the air which enters in; the most severe of all, when gathering and swelling up around the sinews and the blood-vessels in these parts it strains the tendons of the shoulders and the muscles attached to them in a backward direction: and owing to the intense strain produced in this condition these affections are called tetanus and opisthotonus. For these the remedy is severe: for in fact fevers supervening chiefly give relief in such cases. The white phlegm when intercepted is dangerous owing to the air in the bubbles: but when it finds an escape to the surface of the body it is more mild; yet it disfigures the person by engendering scabs and leprosies and kindred maladies. Sometimes it is mingled with black bile and is shed upon the revolutions in the head, which are the most divine, and confounds them; and if this occurs during sleep, the effects are milder, but if in the waking hours, it is harder to relieve. This, as affecting the sacred part, is justly called the sacred disease. Acid and saline phlegm is the source of all diseases that take the form of catarrh: and these have received manifold names according to the diverse places in which the discharge takes place. Inflammations in various parts

night as well as during the day, but in some instances they are entirely nocturnal, and it is well known that in such cases the disease may long exist and yet remain unrecognised either by the patient or the physician.' Dr Affleck in the Encyclopaedia Britannica, article Epilepsy.

16. ἐνδικώτατα [ερόν λέγεται] The name ἐρόν νῦνσος was given to epilepsy because, owing to the suddenness of the attack and its appalling symptoms, it seemed like the direct visitation of some divine power, which without warning struck down its victim. Hippokrates in the true scientific spirit protests against this superstition: see de morbo sacro vol. i p. 587 Kühn οὐδὲν τι μοι δοκεῖ τῶν ἄλλων θειοτέρη ἐναι νοῦσων οὐδὲ ἱερωτέρη, ἀλλὰ φιασίν μὲν ἐξεῖ ἢ καὶ τὰ λοιπὰ σουσίματα ὑπὲν γίνεται. φῶσιν δὲ αὐτῆ καὶ πρόφασιν οἱ ἄνθρωποι ἐνόμισαν θείου εἶναι ὑπὸ ἀπειρίας καὶ θαναμασίωτος, ὅτι οὐδὲν δοκεῖ ἐνέργει νοισίως. καὶ κατὰ μὲν τὴν ἀπορίαν αὐ- τοῦ τοῦ μὴ γινώσκειν τὸ θείου αὐτῆ διασφί- χεται, κατὰ δὲ τὴν εὐπορίαν τοῦ τρόπου τῆς ἱγίοσι ἱ νωται· ἀπολύονται γὰρ ἡ καθερ- μοῖς ἡ ἐπαιδήσια. Plato, as his manner is, adopts the popular appellation, but gives it a new and higher significance of his own: it is the sacred disease because peculiarly affecting the divinest part of us.

18. καταρροϊκά] i.e. catarrhs, in whatever part of the body they may occur.

19. φλεγμαίενες λέγεται] Notwithstanding the name φλεγμαίενες, Plato would say, inflammations are not owing to φλέγμα at all, but to χολή.
λέγεται τοῦ σώματος, ἀπὸ τοῦ κάεσθαι τε καὶ φλέγεσθαι, διὰ χολὴν γέγονε πάντα. λαμβάνουσα μὲν οὖν ἀναπνοὴν ἐξω παντοῦ, καὶ ἀνατέμπει φύματα ζέουσα, καθειργυμνεύῃ δὲ ἐντὸς πυρίκαυτα νοσήματα πολλὰ ἐμποιεῖ, μέγιστον δὲ, ὅταν αἷμα καθαρὸν ἕγγεκρινε τὰ τῶν ἰνῶν γένος ἐκ τῆς ἕαυτῶν διαφοράς τάξεως, αἱ διεσπάρσαν μὲν εἰς αἷμα, ίνα συμμετρῶς λεπτότητος ἵσχοι καὶ πάχους καὶ μῆτε διὰ θερμότητα ὡς ύδρῶν ἐκ μαυρί τοῦ σώματος ἐκρέου, μητ' αὖ πυκνότερον δυσκίνητον ὃν μόλις ἀναστρέφοιτο εὖ ταῖς φλέψι. καὶ τοῖς δὴ τούτων ἱες τῇ τῆς φύσεως γενέσει φυλάτ-

dio τουσιν ἄς ὅταν τις καὶ τεθνεώτος αἷματος ἐν ψύξει τε ὑπὸ τοῦ πρὸς ἂλλήλας συναγάγῃ, διαχεῖται πάν τὸ λοιπὸν αἷμα, ἐαθείσαι δὲ ταχὺ μετὰ τοῦ περιεστώτος αὐτὸ φύσις ξυμπηγνύει. ταύτην δὴ τὴν δύναμιν ἐχοῦσών ἰνῶν ἐν αἷματοι χολὴ φύσει παλαιῶν αἵματα γεγονοῦσα καὶ πάλιν ἐκ τῶν σαρκῶν εἰς τοῦτο τετηκυία, θερμῆ καὶ ἑγρά καὶ ὀλυγόν τοῦ πρατόν ἐμπίπτουσα πηγνύει διὰ τὴν τῶν ἐ ἰνῶν δύναμιν, πηγνυμένη δὲ καὶ βίᾳ κατασβεννυμένη χειμώνα καὶ τρόμος ἐντὸς παρέχειν πλεῖον δ᾽ ἐπηρέουσα, τῇ παρ᾽ αὐτῆς θερμότητι κρατήσασα, τὰς ἵνας εἰς ἀταξίαν ἔσασα διέσειε' καὶ ἐὰν μὲν ἰκανή διὰ τέλους κρατήσασα ἑγνύεται, πρὸς τὸ τοῦ μνελοῦ διαπεράσασα γένος καίουσα ἐλυσε τὰ τῆς ψυχῆς αὐτὸθεν οἷον νεως πείσματα μεθηκὲ τε ἐλευθέραν ὅταν δ᾽ ἐλίπτον ἢ τὸ τε σῶμα ἀντίσχη τηρομενον, αὐτὴ κρατηθείσαι ἢ κατὰ πάν τὸ σῶμα ἐξεπεσε, ἢ διὰ τῶν φλεβῶν εἰς τὴν κάτω ἐνωσθείας ἢ τὴν ἀνω κοιλίαν, οἷον φυγὰς ἐκ πόλεως στασιασάσης ἐκ τοῦ σώματος διαπέρασασα, διαρροίας καὶ δυσεντερίας καὶ τὰ τοιαῦτα νοσήματα 86 καὶ πάντα παρέσχετο. τὸ μὲν οὖν ἐκ πυρὸς ὑπερβολὴς μάλιστα

8 μόλις: μόγις SZ. 9 τοῦτων: τοῦτον Α. 17 αὕτη: αὕτης AHS. 22 αὕτη: αὕτη Α.

1. διὰ χολὴν γέγονε πάντα] This was, according to Aristotle, the opinion of Anaxagoras and his school: cf. de partibus animalium IV ii 677a 5 οὐκ ὄρθως δὲ λοικαίνοι οἱ περὶ Ἀναξαγόραν ὑπολαμβάνειν ὡς αἰτίαν οὔσαν [sc. τὴν χολὴν] τῶν ὑζέων νοσημάτων ὑπερβάλλουσαν γὰρ ἀπόρραίνει πρὸς τοῦ πλέυμονα καὶ τὰς φλέβας καὶ τὰ πλευρά.

2. λαμβάνουσα μὲν οὖν ἀναπνοὴν i.e. when it is thrown off in an eruption: Plato is aware that the suppressed inflammation is much more dangerous.

7. ἐκ μαυρί τοῦ σώματος ἐκρέου] i.e. percolate through the substance of the body.

11. διαχείται πάν τὸ λοιπὸν ἀἷμα] Hence we see that although Plato conceived that flesh was formed by condensation of the ἓξωρ (82 D), he did not suppose that blood deprived of the ἱερες would coagulate on exposure to the air.

13. παλαιὸν ἀἷμα γεγονοῦσα] The flesh is formed of the blood, and χολὴ (that is,
of the body, so called from the heat and burning that occurs, are all due to bile. When they have egress, they seethe up and send forth all kinds of pustules; but if they are suppressed within, they cause many inflammatory diseases; of which the worst is when the inflammation entering into pure blood carries away from its proper place the fibrine which was distributed through the blood in order that it might preserve a due measure of thinness and thickness and neither be so much liquefied by heat as to flow out through the porous texture of the body, nor become sluggish from excessive density and circulate with difficulty in the veins. Now the fibrine by the nature of its composition preserves the due mean in these respects. For if from blood that is dead and beginning to cool the fibrine be gathered apart, the rest of the blood is dissipated; but if the fibrine be allowed to remain, by the help of the cold air surrounding, it quickly congeals it. The fibrine then in the blood having this property, bile which is naturally formed of old blood and is dissolved again into blood out of the flesh, enters warm and liquid into the blood, at first gradually, and is condensed by the power of the fibrine; and as it is condensed and forced to cool, it produces internal chill and shivering. But when a greater quantity flows in, it subdues the fibrine with its heat, and boiling up scatters it abroad; and if it is able to obtain the mastery to the end, it penetrates to the substance of the marrow, and consuming it looses from thence the bonds of the soul, as it were the moorings of a ship, and sets her free. But when the bile is too feeble for this, and the body holds out against the dissolution, itself is vanquished, and either is expelled by an eruption over the whole body, or is driven through the veins into the lower or upper belly, like an exile banished from a city that has been at civil war; and as it issues forth from the body, it causes diarrhoea and dysentery and all diseases of that kind.

When a body has been stricken with sickness chiefly through χολή of a morbid nature) is formed by degeneration of the flesh, and hence is παλαιώ αλμα.

20. οἶνον νεῶς πείρατος] Compare 74 ά καθάπερ ἐξ ἄγκυρων βαλλόμενον ἐκ τούτων πάσης ψυχῆς δεσμῶν.
voσήσαν σῶμα ἥνεκή καύσαι καὶ πυρετοὺς ἀπεργάζεται, τὸ δ’ εἶ ἄνοιαν ἀμφημερίνους, τριταίους δὲ ὑδάτος διὰ τὸ ναυθέστερον ἄρος καὶ πυρὸς αὐτὸ εἶναι: τὸ δ’ ἐκ γῆς, τεταρτῶς δὲ νωθέστατον τούτων, ἐν τετραπλασίαις περίοδοις χρόνου καθαριόμενον, τεταρταῖοι πυρετοὶ ποιήσαν ἀπαλλάττεται μόνος.

XLI. Καὶ τὰ μὲν περὶ τὸ σῶμα νοσήματα ταῦτη ἐμβαίνει Β γεγονόμενα, τὰ δὲ περὶ ψυχήν διὰ σώματος ἔξιν τῇδε. νόσον μὲν δὴ ἤνεκή ἀνοιαν ἐγχερητέον, δύο δὲ ἀνοιας γῆν, τὸ μὲν μαμίαν, τὸ δὲ ἀμαθιὰν. τὰν οὖν τι πάσχοι τις πάθος ὑπότερον αὐτῶν ίσχει, νόσον προσηρήτεον, ἱδονάς δὲ καὶ λύπασ ὑπερβαλλούσας τῶν νόσων μεγίστας θετέον τῇ ψυχῇ: περιχαρῆς γὰρ ἀνθρωπὸς ὃν ἦ καὶ τάναυτία ὑπὸ λύπης πάσχων, σπεύδου τὸ μὲν ἔλειφ ἄκαλρος, θ τὸ δὲ φυγεῖν, οὐθ’ ὀρᾶν οὔτε ἀκουεῖν ὁρῆθ’ οὐδὲν δύναται, λυττά δὲ καὶ λογισμοῦ μετασχεῖν ἥκιστα τὸτε δὴ δυνατός ἐστι. τὸ δὲ

3 τὸ δ’ ἐκ: τὸ δὲ ΣΖ. 5 μόγις, ut videtur, Α. μόλις II.

2. ἀμφημερίνους] i.e. cases in which there is a period of fever and a period of relaxation in every twenty-four hours. As Martin observes, the names given to these recurrent fevers denote, not their period, but the number of days necessary for determining the period: thus in a τριτάιος there is a day of fever and a day of relief; the fever returning on the third day marks the period as comprising two days: similarly in a τεταρταίος there is a day of fever and two days of relief, the fever returning on the fourth day. Galen de plac. Πηρ τοι αντιλ. VIII 657 disputes Plato's account of fever, which he ascribes not to the four elements, but to the four primary fluids of the body. The ancient medical writers also mention a species of tertian fever called ἡμιτριτάιος, the period of which was thirty-six hours of fever (more or less) and twelve hours of comparative relaxation; see Celsius III 3, 111 8.

86 B—87 B, c. xli. Maladies of the soul arise from morbid conditions of the body. Now the sickness of the soul is foolishness; and of this there are two kinds, madness and ignorance. Pleasure and pain in excess are the most calamitous of mental disorders, for they lead a man vehemently to seek one thing and eschew another without reflection or understanding. Whenever the seminal marrow is abundant and vigorous, it prompts to indulgence in bodily pleasures which enfeeble the soul. But the profligate are unjustly reproached as criminals: in truth they are sick in soul. For no one is willingly evil; this comes to a man against his will through derangement. For when the vicious humours of the body are pent up therein and find no vent, the vapours of them rise up and choke the movements of the soul at all her seats, causing moroseness and melancholy, rashness and cowardice, forgetfulness and dulness. And these evils are further aggravated by bad institutions and teaching and lack of wholesome training. Wherefore the teachers are more to blame than the sinners themselves, whom we ought to strive to bring into a healthier habit of mind.

7. διὰ σώματος ἔξις] The corporeal ἔξις which cause sickness to the soul may be classified in two divisions. (1) susceptibility to pleasures and pains (these arise from σώματος ἔξις, because, although it is the soul, not the body that
excess of fire, it exhibits continued inflammations and fevers; excess of air causes quotidans fevers; excess of water tertian, because it is more sluggish than air or fire; excess of earth, which is by four measures most sluggish of all, being purged in a fourfold period of time, gives rise to quartan fevers, and is with difficulty banished.

XLI. Such are the conditions connected with diseases of the body; those of the soul depend upon bodily habit in the following way. We must allow that disease of the soul is senselessness; and of this there are two forms, madness and stupidity. Every condition then in which a man suffers from either of these must be termed a disease. We must also affirm that the gravest maladies of the soul are excessive pleasures or pains. For if a man is under the influence of excessive joy, or, on the other hand, of extreme pain, and is eager unduly to grasp the one or shun the other, he is able neither to see nor to hear anything aright; he is delirious, and at that moment entirely unable to obey reason.

perceives them, yet they affect the soul through the body), which blind a man to his real interest and highest happiness: (2) physical ill health, which, by enfeebling the parts through which the soul acts upon the body, impedes her actions and stifles her intelligence. Compare Phaedo 66 B μυρίας μέν γὰρ ἡμῶν ἀσχολίας παρέχει τὸ σῶμα διὰ τὴν ἀναγκαίαν τροφὴν· ἐτι δ' ἄν τινες νόσοι προσπέσουν, ἐμποδίζουσιν ἡμῶν τὴν τοῦ ὄντος θύραν.

8. τὸ μὲν μανίαν, τὸ δὲ ἀμαθίαν] This classification, though not discordant, is not identical with that given in Sophist 228 A foll. In that passage we have two εἴδη of καλία in the soul, one being a νόσος or στάσις, the other αἰτία or ἀμαθία. The νόσος is πνεύμα, the αἰτία is ἀγνοία. Further ἀγνοία is subdivided into ἀμαθία, defined as τὸ μηκενίδιτα τι δοκεῖν εἰδέναι, and τὰ ἀλλα μέρη ἀγνοίας, which are left unnamed. In the Timaeus the distinction between νόσος and αἰτία is sunk: for all that belongs to πνεύμα in the Sophist here falls under ἀνοία, whereof ἀμαθία also is a form. This does not mean any ethical discrepancy between the two dialogues; rather the minuter διάλεκτος of the Sophist is made in furtherance of the dialectical ends of that dialogue, but is needless for the ethical object of the present passage. ἀμαθία can hardly be translated by any English word: it signifies ignorance combined with dulness which hinders the ἀμαθίας from perceiving his ignorance. It must also be observed that μανία is not simply ‘madness’ in the ordinary sense of the word: as ἀμαθία is a defect of the θεῖον εἴδος τῆς ψυχῆς, a failure of reason, so is μανία a defect of the θεῖον εἴδος, a want of due subordination to the θεῖον, leading to incontinence and the supremacy of the passions.

II. περιχαρής γὰρ ὁμι] i.e. excessive sensiveness either to bodily pleasure or pain is a species of madness which distracts the soul and prevents her from exercising the reason, impelling a man blindly to seek the pleasant and shun the painful without consideration of τὸ βέλτιστον.
σπέρμα ὡς τοῦ πολλοῦ καὶ μνεῖς περὶ τῶν μυστήρων γίγνεται καὶ 
καθαπερεί δένδρον πολυκαρπότερον τοῦ ξυμμέτρου πεθυκὸς ἵ
πολλάς μὲν καθ' ἕκαστον ὁδῖνας, πολλάς δὲ ἡδονὰς κτῶμενοι ἐν

καὶ

1 γίγνεται: scrips: γίγνεται AHSZ codicesque omnes. καὶ inclusit H. 7 κα-
κῶς post κακῶς cum Λ omisi. servant HSZ. in nonnullis codicibus, qui κακῶς 
tuentur, abest κακῶς.
10 ἀκράτεια: ἀκρατία S.

1. περὶ τῶν μυστήρων] Compare 73 C, 
91 c.

γίγνεται] I believe this slight alter-
ation restores Plato's sentence. The 
vulgate γίγνεται καὶ cannot possibly 
stand; and Hermann's excision of καὶ 
leaves a construction sorely needing de-
fence. Of the omission of ἄν with the 
relative instances are to be found in Attic 
prose; see Thucydides iv xvii 2 ἐτυχώ-
μον ὄν ἡμῖν, οὐ μὲν βραχεῖς ἄρκοσι, μὴ 
πολλὸς χρήσοι. And above in 57 B we 
have the very similar construction πρὶν...
ἐκφύγη: and so Laws 873 A πρὶν...κομίζῃ.

4. τοῖς περὶ τὰ τοιαύτα τόκοις] i.e.
pleasure exists (1) in desire, (2) in the 
gratification of desire. Note that Plato 
says, not that pleasure is ἐπιθυμία, which 
would be contrary to his principles, but 
that it is ἐν ταῖς ἐπιθυμίαις: it is pleasure 
of anticipation. See Philo 1.35 E foll. 
τόκοι of course signifies the realising of 
the anticipation.

8. τὴν ἐνὸς γένους ἔξιν] sc. τοῦ μυς-
λοῦ.

10. ἀκράτεια καὶ ὄνειδος] The text 
seems hitherto to have escaped suspicion; 
but certainly the phraseology is very ex-
traordinary: I see however no plausible 
correction.

12. κακὸς μὲν γὰρ ἐκὼν οὐδεὶς] This 
passage is one of the most important 
ethical statements in Plato's writings. 
Plato's position, which he maintains con-
sistently from first to last, that all vice 
and error are involuntary, is clearly to be 
distinguished from the Sokratic identifica-
tion of ἁρετή with ἐπιστήμη, κακὰ with 
ἀμβία. In the Platonic doctrine ἐπι-
στήμη is the indispensable condition to 
true ἁρετή (not to δημοτική καὶ πολιτικὴ 
ἁρετή), and his teaching on this point is 
part of a comprehensive theory of deter-
minism. No man, he says, wilfully and 
wittingly prefers bad to good. In making 
choice between two courses of action 
the determining motive is the real or 
apparent preponderance of good in one: 
if a man chooses the worse course, it is 
because either from physical incapacity 
or faulty training, or both combined, his 
discernment of good has been dimmed or 
distorted. We ought not then to rail 
upon him as a villain, but to pity him 
as one grievously afflicted and needing 
succour: compare Laws 731 c, D πᾶς δὲ 
ἀδίκους οὐχ ἐκὼν ἄδικοι...ἀλλὰ ἐλευθός μὲν 
τάντως δὲ γε ἄδικος καὶ ὁ τὰ κακά ἔχων, 
ἔλεειν δὲ τὸν μὲν ἰάσαμα ἔξοντα ἐγχορεῖ 
καὶ ἀνείργοντα τὸν θυμὸν πραΰνειν καὶ μη
In whosoever the seed in the region of the marrow is abundant and fluid and like a tree that is fruitful beyond due measure, he feels from time to time many a sore pang and many a delight amid his passions and their fruits; and he becomes mad for the greater part of his life owing to the intensity of pleasures and pains, keeping his soul in a state of disease and derangement through the power of the body; he is not however regarded as sick, but as willingly vicious. But the truth is that incontinence in sensual pleasures is a disease of the soul for the most part arising from the fluid and moist condition of one element in the body owing to porousness of the bones. So it is too with nearly all intemperance in pleasure; and the reproach attaching thereto, as if men were willingly vicious, is incorrectly brought against them. For no one is willingly wicked; but it is owing

\[ \text{δικραχυλωτρα.} \] He admits however that \( \thetaυμος \) is a useful ally in desperate cases: \( \tau\nu\ \deltaι \ \alphaκρατως \ \kappaαι \ \απαραμεθητως \ \piλημ-\]

\[ \text{μελετι και \ kακω} \ \text{εφευνα \ δε \ την \ οργην} \kappaι\]

\[ \text{dιδ δη \ \θυμοειδη} \ \text{πρωτειν και \ πραδω} \ \text{fαινεν \ εκα-}\]

\[ \text{στοτε \ ειναι \ δειν \ των} \ \text{αγαθων.} \] Hence it necessarily follows that all punishment is either curative or deterrent, never vindicative or retributive; of this there are many explicit statements; see \( \text{Laus} \ 854 \ \text{D,} \ 863 \ \text{D, E, and especially 934 A; Phaedo} \)

\[ \text{113 D, E, Gorgias 477 A, 505 C, 525 B.} \] The greatest benefit we can confer upon

\[ \text{the wicked is to punish them and so deliver them from their wickedness. Even the punishment of death inflicted upon incurable criminals is regarded not only as a protection to society and as a warning to the evil-disposed, but also as a deliverance to the offender himself from a life of guilt and misery: cf. Laus 958 A \}

\[ \text{oτι \ δε \ δυστα} \ \text{επικεκλωσμενα, οδατον} \ \text{λαμα-}\]

\[ \text{ταις} \ \text{oυτω} \ \text{διατεθεισαι \ ψυχαι} \ \text{διανεμοντες,} \ \text{also 854 C.} \]

Now this view of vice, that it is an involuntary affection of the soul, will be seen to be an inevitable inference from Plato's ontology; and it well illustrates how admirably the various parts of his system fit together. Soul, as such, is good entirely. Absolute being, absolute

\[ \text{thought, and absolute goodness are one} \]

\[ \text{and the same. Therefore from the abso-}\]

\[ \text{lute or universal soul can come no evil.} \]

\[ \text{The particular soul is derived from the} \]

\[ \text{universal soul, whence she has her es-}\]

\[ \text{sence: therefore her nature, \text{qua} soul,} \]

\[ \text{is entirely good. No evil therefore} \]

\[ \text{can arise from the voluntary choice of} \]

\[ \text{the soul. Evil then must of necessity} \]

\[ \text{arise from the conditions of her limita-}\]

\[ \text{tion, which takes the form of bodily en-}\]

\[ \text{vironment. And it is clear that all} \]

\[ \text{defects in this respect are due either to} \]

\[ \text{physical aberrations or faulty treatment.} \]

\[ \text{Therefore Plato's ethical is necessitated} \]

\[ \text{by his ontological theory. And the In-}\]

\[ \text{preter's declaration in the \text{Republic} \ \text{A}l\text{e} \ \text{O}λ\text{o}μ\text{e}νον, δε\text{σ λατατος} \ \text{not only is} \]

\[ \text{not inconsistent with the maxim \text{κακος} \ \text{εκων} \ \text{οδελς,} \ \text{but is inevitably implied in} \}

\[ \text{it: each statement in fact involves the} \]

\[ \text{other and could not be true without it.} \]

In the region of sensibles ugliness and deformity are due to the imperfect manner in which the senses convey to us representations of the ideas: a perfect symbol of an idea would be perfectly beautiful; all imperfection being due to divergence from the type. So also moral deformity is due to divergence from the type; and the choice of evil arises from
imperfect apprehension of the type. All men necessarily desire what is good: but many causes combine to distort their apprehension of the good: whence arises vice.

2. ἐξορὰ καὶ ἀκοντί] Cornarius' correction of κακὸν τι into ἀκοντί seems nearly as certain as an emendation can be; and I can only wonder at Stallbaum's defence of the old reading. Perhaps Plato wrote the words as a crasis, κάκον τι: this would readily become κακόν τι, after which the insertion of καὶ before it would follow as a matter of course.

3ο περὶ τὰς λύτας] Here then we see what Plato means by calling pains ἀγαθῶν φύγαλ in 69 D.

8. μᾶλλον καὶ ἥττον] I apprehend that these words apply to the intensity of the attack, ἐλάστω καὶ πλεώ to the gravity of the disorder. There is a similar combi-

nation of μᾶλλον καὶ ἐπὶ πλεῦν with ἤττον καὶ ἐπ' ἔλαττον in Phaedo 93 B.

πρὸς τὰς τρεῖς τόπους] i.e. the seats of the three ἔσθη of the soul, the liver, heart, and head: attacking the first, the vapours produce δυσκολία and δυσθυμία, attacking the heart, θρασύτης and δείλια, attacking the brain, they cause λήθη and δυσμαθία. The view that mental deficiencies are frequently due to bodily infirmity can be traced back to Sokrates: cf. Xenophon memorabilia 111 xii 6 ἐν πάσαις δὲ ταῖς τοῦ σώματος χρείαις πολὺ διαφέρει ὡς βλέπτωσα τὸ σῶμα ἔχειν' καὶ γὰρ ἐν ψυκῆς ἡ ἀληθινὴν τοῦ σώματος χρείαν ἔλαιν, ἐν τῷ διανοεῖσθαι, τίς οὖκ οἶδεν δικαίκως ἐν τούτῳ πολλοὶ μεγάλα σφᾶλλονται διὰ τὸ μὴ ἔγναίναι τὸ σῶμα; καὶ λήθη δὲ καὶ ἀθυμία καὶ δυσκολία καὶ μαζί πολλαὶ πολλοὶ διὰ τὴν τοῦ σώματος κακεξίαν εἰς τὴν διάφορα ἐμπίπτουσιν οὕτως, ὡστε καὶ τὰς ἐπιστήμας ἐκβάλλειν.
to some bad habit of body and unenlightened training that the wicked man becomes wicked; and these are always unwelcome and imposed against his will. And where pains are concerned, the soul likewise derives much evil from the body. For where the humours of acid and salt phlegms and those that are bitter and bilious roam about the body and find no outlet to the surface, but being pent up within and blending their own exhalations with the movement of the soul are mingled therewith, they induce all kinds of mental diseases, more or less violent and serious: and rushing to the three regions of the soul, in the part which each attacks they multiply manifold forms of moroseness and melancholy, of rashness and timidity, of forgetfulness and dulness. And when, besides these vicious conditions, there are added bad governments and bad principles maintained in public and private speech; when moreover no studies to be an antidote are pursued from youth up, then it is that all of us who are wicked become so, owing to two causes entirely beyond our own control. The blame must lie rather with those who train than with those who are trained, with the educators than the educated: however we must use our utmost zeal by education, pursuits, and studies to shun vice and embrace virtue. This subject however belongs to a different branch of inquiry.

10. ποικιλεί μὲν εἰδῆ] This comes to the same thing as γεννᾷ ποικιλὰ εἰδῆ. 14. λεξιθώσιον] There is an obvious zeugma here; with πολιτείαν we must mentally supply something like ξενάτωσιν. ιδία καὶ δημοσία is used as in 88 Α. 16. ὑν αληταστὸν] Compare the famous passage in Republic 492 Α ἢ καὶ εἰ ἢγεῖ ὥσπερ οἱ πολλοὶ, διαφθειρομένους τιμᾶς εἶναι ὑπὸ σοφίστῶν νέοις, διαφθειροντας δὲ τινας σοφιστὰς ἰδιωτικῶς, δὲ τι καὶ ἄξιον λόγου, ἄλλῳ οὐκ αὐτοῦ τοῖς ταῦτα λέγοντας μεγίστους μὲν εἰναι σοφιστὰς, παιδεύειν δὲ τελεώτατα καὶ ἀσπεργάσεσθαι οἷον βούλονται εἶναι καὶ νέους καὶ πρεσβυτέρους καὶ ἄνδρας καὶ γυναῖκας; Of course, on the other hand, the same allowance must be made to the teachers also, that they do not educate badly from preference of the bad, but because they know no better.

19. ταῦτα μὲν οὖν δή] i.e. the evil results of physical imperfection and bad training. The discussion of this subject, Plato says, is τρόπος ἄλλος λόγων, that is to say, it belongs to an ethical treatise.

87c—89 D, c. xliii. But it is a pleasanter task to describe the means whereby the body is preserved and strengthened. All that is good is fair, all that is fair is symmetrical. Now we take great heed to lesser symmetries, but the most important of all, the symmetry of soul and body, we utterly neglect. Neither should the body be too weak for the soul, nor the soul too weak for the body. Just as some bodily disproportion is the cause of pain and fatigue to the sufferer, so it is here: either the soul wears out the body in her pursuit of knowledge, or the body hampers and stifles the soul. The only safeguard is to give due exercise both to

body and to soul: the student must practise gymnastic, the athlete must cultivate his mind. We must in this matter follow the law of the universe. For the human body is subject to external influences, which, if left to themselves, quickly destroy it: but if it be exercised on the plan of the universal movement, it will be enabled to resist them; for by exercise the cognate and congenial particles are brought together, and the unlike and discordant are prevented from preying on each other. The best kind of exercise is when the body is moved by its own agency; it is less good if the agent is some external force, especially if only part of the body is moved: simi-

larly of purifications the best is wrought by gymnastic, the next best by conveyance in vehicles; while that by drugs should only be employed in case of positive necessity. For every malady has its own natural period, which it is best not to disturb with medicine; and so has every individual and every species. Nature then should be suffered to take her own course and not be vexed by leechcraft.

3. δικαίωτερον] We are endeavouring to trace how νοῦς ordered all things ἐπὶ τὸ βέλτιστον: therefore it is more appropriate to set forth ἄγαθα than κακά. 5. τὸ δὲ καλὸν οὐκ ἀμετρον] So the good is resolved into the beautiful, and beauty into proportion and symmetry, in
XLII. The counterpart to what has been said, the treatment of body and mind and the principles by which they are preserved, were the proper and fitting complement of our discourse: for it is more just to dwell upon good than upon evil. All that is good is fair, and what is fair is not disproportionate. Accordingly an animal that is to be fair must, we affirm, be well-proportioned. Now the smaller proportions we discern and reason upon them; but of the greatest and most momentous we take no account. For in view of health and sickness and virtue and vice no proportion or disproportion is more important than that existing between body and soul themselves: yet we pay no heed to these, nor do we reflect that if a feeble and smaller frame be the vehicle of a soul that is strong and mighty in all respects; or if the relation between the two be reversed, then the entire creature is not fair; for it is defective in the most essential proportions. But the opposite condition is to him who can discern it of all sights the fairest and loveliest. For example, a body which possesses legs of excessive length or which is unsymmetrical owing to any other disproportion, is not only ugly, but in taking its share of labour brings infinite distress on itself, suffering frequent fatigue and spasms, and often falling in consequence of inability to control its motions: the same then we must suppose to hold good of the combination of soul and body which we call an animal; when the soul in it is more powerful than the body and of ardent temperament, she agitates it and fills it from within with sickness; and when she impetuously pursues some study or research, she wastes the body away: and in giving instruction and conducting discussions private or
neikias γυγομένων διάτυρον αὐτῷ ποιούσα λύει, καὶ ῥεύματα ἐπάγγευσα, τῶν λεγομένων ἦταρών ἀπατώσα τοὺς πλείον, τάναντια αἰτιάσαται ποιεῖ: σῶμά τε ὅταν αὐτῷ μέγα καὶ ὑπέρψιχον σμικρὰ ἀξιμαφνεύς ἀσθενεῖ τα διανοι ἵγεται, διττῶν ἐπιθυμιῶν οὐσῶν φύσει ὧν κατ' ἀνθρώπους, διὰ σῶμα μὲν τροφῆς, διὰ δὲ τὸ θεϊτάτον τῶν ἐν ἑμῖν φρονίσεως, αἱ τοῦ κρείττονός κινήσεις κρατοῦσαι καὶ τὸ μὲν σφέτερον αὐξύσαι, τὸ δὲ τῆς ψυχῆς κοφόν καὶ δυσμαθῆς ἀμνῆμαν τε ποιοῦσαι, τὴν μεγίστην νόσου ἀμαθίαν ἑναπεργάζονται. μιὰ δὲ σωτηρία πρὸς ἁμφό, μήτε τὴν ψυχήν ἄνευ σῶματος κινεῖν μήτε σῶμα ἑνευ ψυχῆς, ὥσ αμυνομένοι γίγνῃσθον ἐσορρόπω καὶ ὑψη. τὸν δὴ μαθηματικὸν ἡ τινα ἄλλην σφάδρα μελέτην διανοῖα κατεργαζόμενον καὶ τὴν τοῦ σῶματος ἀποδοτέον κίνησιν, γυμναστικῆς προσομιλούσα, τὸν τε αὐτῷ σῶμα ἐπιμελῶς πλάττοιτα τὰς τῆς ψυχῆς ἀνταποδοτέον κινήσεις, μονοκη καὶ πᾶση φιλοσοφία προσχρομένον, εἰ μέλλει δικαίως τις ἁμα μὲν καλός, ἁμα δὲ ἁγαθός ὀρθὸς κεκλησεθαι. κατὰ δὲ ταυτα ταυτα καὶ τὰ μέρη θεραπευτέον, τὸ τοῦ παντὸς ἀπομυμουμένου ἐδοσ. τοῦ γὰρ σῶματος ὑπὸ τῶν
dently means forensic oratory on the one hand and eristic discussions on the other, cf. Sophist 225 β, 268 β: dialectic seems to be excluded by δὲ ἐρίδων, perhaps because the calm and dispassionate temper in which the true philosopher conducts his arguments is less likely to lead to injury of his health.

2. τάναντια αἰτιάσαται] The physicians set down to purely physical causes what is really due to the action of a vigorous mind upon a body which is too feeble for it. Martin falls into a strange error in imagining that Plato would actually sacrifice the vigour and excellence of the soul in order to preserve due proportion with the body—'les qualités de l’âme ne sauraient jamais être ni devenir trop belles’. What Plato says is that the model κόσμος is the union of a fair and vigorous soul with a fair and vigorous body; and if the body is too weak for the soul, unfortunate results are likely to happen. For this reason the body ought to receive due attention and training that it may be preserved in such

health and vigour as to render it a fitting vehicle for the soul. But nothing can be more alien to the whole spirit of Plato’s thought than the notion that the soul is not to be cultivated to the highest degree, even though she have the misfortune to be united to an inferior body. We can never make the soul ‘trop belle’; but we must not neglect to keep her corporeal habitation fit for her residence.

3. ἵππεψιχον] i.e. too great for the soul. This reading is indubitably right, although according to the general analogy the word would mean ‘having an excess of soul’, like ἵππερθυμος, and ἰπερεκελεῖς above. The old reading was ἵππεψιχρον, which is found in some mss.

7. τὸ δὲ τῆς ψυχῆς] Compare the passage of the Phaedo 66 β quoted above. The teaching of the present passage is not in any way at variance with the doctrine of the Phaedo that the soul should withdraw herself so far as she can from the company of the body. However completely the body may be in
public in a spirit of contention and rivalry, she inflames and weakens its fabric and brings on chills; and thus deceiving most of the so-called physicians induces them to assign causes for the malady which are really in no way concerned with it. When on the other hand a large body, too great for the soul, is joined with a small and feeble mind,—two kinds of appetites being natural to mankind, on account of the body a craving for nourishment and on account of the divinest part of us for knowledge—the motions of the stronger prevail and strengthen their faculty, but that of the soul they render dull and slow of learning and of recollection, and so produce stupidity, the most grievous of maladies. There is but one safeguard against both these misfortunes: neither should the soul be exercised without the body nor the body without the soul, in order that they may be a match for each other and attain balance and health. So the mathematician, or whosoever is intensively absorbed in any intellectual study, must allow corresponding exercise to his body, submitting to athletic training; while he who is careful in forming his body must in turn give due exercise to his soul, calling in the aid of art and of all philosophy, if he is justly to be called at once fair and in the true sense good. The same treatment too should be applied to the separate parts, in imitation of the fashion of the All. For as the body is inflamed and cooled

subjection to the soul, it must be kept as healthy as possible, else it impedes the activity of the intellect: neglect of the body actually hinders the withdrawal of the soul, since her companion is perpetually forcing itself upon her notice with its maladies. At the same time when Plato is, as here, treating physically of the perfection of the

17. τὸ τοῦ παντὸς ἀπορμομοίματον

ἔδως] i.e. imitating the vibration of the ἐποδοχή, which sifts the elements into their appropriate regions. ὑπὸ τῶν ἐπιστῶν] This seems to refer to the action of fire and air upon the nutriment received into the body: see 79 λ. It is notable that Plato makes the temperature dependent upon internal agencies, assigning to the external merely variation of dryness and moisture: did he know, for instance, that the temperature of the blood is normally almost unaffected by the temperature of the air?

1. upo ton eixwben i.e. by the circumfluent elements: see 81 A.

6. malista men] These words suggest a deuterous plous, implied but not expressed—if possible keep the body in constant activity, or at least as nearly so as may be'.

7. seismous ale tinas] Plato’s meaning is that the natural and voluntary motions of the body will do for it what the vibration of the unudoxi does for the universe; that is to say, it will sift things into their right places. The various forces which act upon the body tend to dissolve its substance and confuse it at random, and thus produce sickness and discomfort by the juxtaposition of ungenial and incongruous particles.

11 elygenmen: leytomen A.

This is counteracted by the natural movement of the body, which restores the due relative position of the particles: thus if upo ton eixwben a particle of water is changed into one of air, and so we have air where water ought to be, the motion of the body sends the air where it ought to be and supplies its former place with water. In such manner equilibrium and health are preserved.

9. pathmata kai meri] A somewhat curious collocation. The pathmata are roaming about the body seeking anapno, which the seismoi enable them to find: the meri are the elemental particles, which are thus shifted each into its proper place.

13. ton D av kinesisewn] The modes
within by the particles that enter, and again is dried and moistened by those that are outside, and by the agency of these two forces suffers all that ensues upon these conditions, if we submit the body passively to the forces aforesaid, it is overcome and destroyed: but if we imitate what we have called the fastness and nurse of the All, and allow the body, if possible, never to be inactive, but keep it astir and, exciting continual vibrations in it, furnish it with the natural defence against the motions from without and within; and by moderately exercising it bring into orderly relation with each other according to their affinities the affections and particles that are going astray in the body; then, as we have already described in speaking of the universe, we shall not suffer mutually hostile particles to be side by side and to engender discord and disease in the body, but we shall set friend beside friend so as to bring about a healthy state. Of all motions that which arises in any body by its own action is the best (for it is most nearly allied to the motion of thought and of the All), but that which is brought about by other agency is inferior; and the worst of all is that which, while the body is lying still, is produced by other agents which move it piecemeal. Accordingly of all modes of purifying and restoring the body gymnastic is the best; the next best is any swinging motion such as of sailing or any other conveyance of the body which does not tire it: a third kind is useful sometimes under absolute necessity, but in no other circumstances should be employed by a judicious person, I mean medical purgation effected by drugs. No disease, not involving imminent danger, should be irritated by drugs. For

in which the body may be exercised are threefold: (1) when it moves itself as a whole; (2) when it is moved as a whole by some external agency; (3) when parts are moved by external agency, the rest remaining stationary. The first and best is gymnastic; the second travelling in a boat or any other means of conveyance; the third includes the action of medical cathartics, which are to be avoided, unless absolutely necessary. Compare Laws 789 c τὰ σώματα πάντα ὑπὸ τῶν σεισμῶν τε καὶ κινήσεων κινούμενα ἄκοπα ἄλωναι τῶν ἀτομῶν ῥᾳδίως ἤ τὰ ἄνθρωπα τῷ θάλασσαν καὶ ἐφ’ ἕποιν ὁχύμενα καὶ ὑπ’ ἄλλου ὑπωσών ὑή φερομένων τῶν σωμάτων κινεῖται. 18. αἰλωνήσεων] This refers probably to a gymnastic machine called αἴλων, a kind of swing.

πάσα γὰρ ἔξωτασίς νόσων τρόπον τινὰ τῇ τῶν ζῴων φύσει προσέχει. καὶ γὰρ ἡ τούτων ξύνοδος ἔχουσα τεταγμένως τοῖς βίον γίγνεται χρόνους τοῦ τε γένους ἔξωπαντος καὶ κατ’ αὐτὸ τὸ ζῷον εἰμαρμένου ἔκαστον ἔχον τοῖς βίον φύτει, χωρὶς τῶν ἐξ ἀνάγκης παθημάτων. 

1. πάσα γὰρ ἔξωτασίς] Every form of disease has a certain correspondence with the constitution of animals. For as there are fixed periods for which both the individual and the species will endure, but no longer, seeing that the elementary triangles are calculated to hold out a certain definite time against the forces of dissolution, even so every disease has its fixed period to run; and if this be rashly interfered with by medicine, a slight ailment may easily be converted into a dangerous sickness. Compare the discussion on medical treatment in Republic 405 D foll.

2. ἡ τούτων ξύνοδος] Their conjunction, i.e. their composition or constitution.

3. τοῦ τε γένους ἔξωπαντος] Plato's statement that the species wears out as well as the individual is very notable. Although he does not explain the cause why a species becomes extinct, we may well suppose him to conceive that in course of generations the triangles transmitted by the parent to the offspring are no longer fresh and accurate; so that every succeeding generation becomes more feeble, and finally the race disappears.

4. χωρὶς τῶν ἐξ ἀνάγκης παθημάτων] i.e. apart from accidents or illness. This use of the word ἀνάγκη falls in with the explanation of it offered above on p. 166.

10. διὸ παιδαγωγεῖν] That is, we should guide the disease, not drive it; and by suitable diet and mode of life suffer it to run its course in the easiest and safest way.

11. καθ’ ὅσον ἂν ἡ τῷ σχολῆ] i.e. he must not pay exclusive attention to it so as to leave no time for mental culture.
every form of sickness has a certain correspondence to the nature of living creatures. Their constitution is so ordered as to have definite periods of life both for the kind and for the individual, which has its own fixed span of existence, always excepting inevitable accidents. For the triangles of each creature are composed at the very outset with the capacity of holding out for a certain definite time; beyond which its life cannot be prolonged. The same applies also to the constitution of diseases; if these are interfered with by medicine to the disregard of their appointed period, it often happens that a few slight maladies are rendered numerous and grave. Wherefore we should guide all such sicknesses by careful living, so far as we have time to attend to it, and not provoke a troublesome mischief by medical treatment.

XLIII. Now so far as concerns the animate creature and the bodily part of it, how a man, guiding the latter and by himself being guided, should live a most rational life, let this discussion suffice. But the part which is to guide the body must beforehand be trained with still greater care to be most perfect and efficient for education. To deal with this subject minutely would in itself be a sufficient task: but if we may merely touch upon it in conformity with our previous discourse, we should as there are three forms of soul existing in man, that form will be the most powerful which is most fully exercised. Wherefore he must be careful to give freest activity to that divinest part, which is his guiding genius, and which lifts him up towards his birthplace in the heavens. For he whose care is for earthly lusts and ambitions will become, so far as that may be, mortal altogether, he and all his thoughts; but whoso sets his heart upon knowledge and truth, he, so far as man may attain to immortality, will be immortal and supremely blessed. And this he must ensue by dwelling in thought upon the eternal truth; and making his soul like to that she contemplates, so he will fulfil the perfect life.

13. τοῦ κολοσίου ζῷου] i.e. the living creature consisting of soul and body united, the ζωικομούσερον.

14. διαπαιδαγωγόν καὶ διαπαιδαγωγούμενον] Stallbaum gives a strange version of this passage. He desires to read ὑπ᾽ αὐτοῦ for ὕπ᾽ αὐτοῦ, giving the truly remarkable result that man must he guided by his body! ‘Cette monstrueuse altération du texte’, as Martin not too forcibly terms it, is unworthy of discussion. The vulgate is obviously right; the sense being that a man must train his bodily part and be trained by himself, that is, by his true self, the soul.

15. τὸ δὲ δὴ παιδαγωγήσον] This is of course ψυχῆ.

18. δὲ ἀκριβῶς] Such an exposition does in fact occupy nearly a whole book, the seventh, of the Republic; where we have the following programme laid down: (1) arithmetic, (2) plane geometry, (3) solid geometry, (4) astronomy, (5) harmony, (6) dialectic.
7 δὴ post τὸ δὲ addit S. 14 ἑπιθυμίας: πρὸθυμίας Λ. περὶ ante φιλοσοφίας omittunt SZ. 18 φιλομαθίαν: φιλομάθειαν SZ. τὰς ἀληθείας: τὰς τῆς ἀληθείας S.

2. τρία τριχῇ] This seems a favourite phrase with Plato; see above, 52 D, ὅτε καὶ χωρὰν καὶ γένεσιν εἶναι, τρία τριχῇ. Compare too Sophist 266 D τὶθημι δόο διχῇ πιοτικῆς εἴδη.

7. πρὸς ἀλληλα συμμέτρους] Not in equal measure, but properly proportioned to their relative merits, so that the highest eldos may be supreme, and the two lower in due subordination.

8. ὡς ἀρὰ αὐτὸ δαίμονα] Compare Plutarch de genio Socratis § 22 τὸ μὲν ὦν ὑποβρέχον ὑπὸ τοῦ σώματι ψυχή λέγεται τὸ δὲ φύσις λειφθὲν οἱ πολλοὶ νοῦ καλοῦσιν ἕντος εἶναι νομίζοντας αὐτὸν, ὅπερ ἐν τοῖς ἔσοντοι τὰ φαινόμενα κατ' ἀνταίριγειαν. οἱ δὲ ὀρθῶς ὑπονόουσι ὡς ἕκτος δύτα δαίμονα προσαγορεύοντο. Plutarch here deviates in more than one point from Plato’s doctrine. Plato, in calling the intellect ἀλμων, does not of course mean that it is ἐκτὸς. Also Plutarch, like many of the later, especially neoplatonist, writers, draws an unplatonic distinction between νοῦς and ψυχή, although a little above he has used correcter language. In Plato νοῦς is simply ψυχῆ exercising her own unimpeded functions. Plato gives us to understand that the true ἀλμων ὑπὸ ἐκαστος εἷλαχεν is our own mind: we are to look for guidance not to any external source, but to ourselves, to the divinest part of our nature.

10. πρὸς δὲ τὴν ἐν οὐρανῷ ἀναγένειαν] See 41 D, E. The affinity of the highest part of the soul to the skies is poetically assigned as the cause why man alone of all animals walks upright: compare 91 E foll. It is amusing to compare the prosaic and matter-of-fact treatment of the same
find a consistent answer to the question from the following reflections. As we have often said, three forms of soul with threefold functions are implanted in us, and each of these has its proper motions. Accordingly we may say as briefly as possible that whichever of these continues in idleness and keeps its own motions inactive, this must needs become the weakest; but that which is in constant exercise waxes strongest: wherefore we must see that they exercise their motions in due proportion. As to the supreme form of soul that is within us, we must believe that God has given it to each of us as a guiding genius—even that which we say, and say truly, dwells in the summit of our body and Raises us from earth towards our celestial affinity, seeing we are of no earthly, but of heavenly growth: since to heaven, whence in the beginning was the birth of our soul, the diviner part attaches the head or root of us and makes our whole body upright. Now whoso is busied with appetites or ambitions and labours hard after these, all the thoughts of his heart must be altogether mortal; and so far as it is possible for him to become utterly mortal, he falls no whit short of this; for this is what he has been fostering. But he whose heart has been set on the love of learning and on true wisdom, and has chiefly exercised this part of himself, this man must without fail have thoughts that are immortal and divine, if he lay hold upon

subject by Sokrates: Xenophon memorabilia 1 iv 11.

13. τὴν κεφαλὴν καὶ δέξαν ἡμῶν] The significance of this bold and beautiful metaphor is that, as a plant draws its sustenance through its roots from its native earth, so does the soul draw her spiritual sustenance through the head from her native heavens. Very different is the spirit of Aristotle's comparison, de anima II in 416a 4 ὡς ἡ κεφαλὴ τῶν ἰδέων οὕτως αἱ δέξαι τῶν φυτῶν: the analogy only refers to physical nutriment, cf. II i 412b 3 αἱ δὲ δέξαι τῷ στόματι ἀνάλογον ἀμφότερον ἡμῶν γὰρ εἴχει τὴν τροφήν: and similarly Galen de plac. Hipp. et Plat. v 524 ὡς τοῦ ὕπότου γὰρ τῷ ἔξωτος ἡμῶν ἐς τὸ στόμα, τοῦτον τὸν φυτὸν τὸ πέρας τῆς δέξασθαι ἀτεχνήσει δοκεῖ στοματίων πολλῶν ἀλευρίων ἐκ τῆς γῆς τροφῆν ὑπὸ τῆς φύσεως, διέμεθαι εἰς τὸν ἀνθρώπινον κόσμον.

16. καθοδον μάλατα δυνάτον] Do what he will, he cannot become altogether θνητός, because, to whatever degraded form of organic life he may descend, he always has the ἀθάνατος·ἀρχή which the δημιουργὸς delivered to the gods. τὸ τωτοῦτον ἐκ τοῦ θνητοῦ.

19. φρονεῖν μὲν ἀθάνατα] Compare Symposiastum 212 A ἢ οὐκ ἐνθυμεῖ, ἐφιπτό, εἰ τι ἐνταῦθα αὐτῷ μοναχῷ γενησται, ἐρωτόταί γὰρ ὅ τοῦτον τῷ καλῷ, τίτειν ὅ οὐκ εἰδώλιον ἀρετῆς, ἔτε οὐκ εἰδώλιον ἐφαπτομένην, ἀλλ' ἀληθή, ἀτεχνή, ἀτοῦ ἀληθοῦν ἐφαπτομένην τεκνοῦτε ἐκ ἀρετῆς ἀληθῆ καὶ θρησκευμένη ὑπάρχει θεοφιλείς γενεσθαι, καὶ ἐπερ τῷ ἀλλῷ ἀνθρώπῳ, ἀθάνατον καὶ ἐκεῖνη; see too Aristotle nicomachian ethics x vii

μένας. Plato frequently fuses in his lan-
guage the symbol with what it symbolises,
the perifora with the diainhēs.
the truth; and so far as it lies in human nature to possess immortality, he lacks nothing thereof; and seeing that he ever cherishes the divinest part and keeps in good estate the guardian spirit that dwells in him, he must be happy above all. And the care of this is always the same for every man, to wit that he assign to every part its proper exercise and nourishment. To the divine part of us are akin the thoughts and revolutions of the All: these every man should follow, restoring the revolutions in the head, that are marred through our earthly birth, by learning to know the harmonies and revolutions of the All, so as to render the thinking soul like the object of its thought according to her primal nature: and when he has made it like, so shall he have the fulfilment of that most excellent life that was set by the gods before mankind for time present and time to come.

XLIV. Thus then the task laid upon us at the beginning, to set forth the nature of the universe down to the generation of man, seems wellnigh to have reached its fulfilment. For the manner of the generation of other animals we may deal with in brief, so there be no need to speak at length: thus shall we in our own eyes preserve due measure in our account of them. Let us then state it in this way. Of those who were born as men, such as were cowardly and spent their life in unrighteousness, were, according to the probable account, transformed into women at the second incarnation. At that time the gods for these reasons invented the love of sexual intercourse, in that they created one kind of animate nature in men they have let their reason sleep. And below these were creatures of many legs, and worms that crawl on their belly; and, yet lower, the fish that for their foolishness may not even breathe pure air, and all living things whose habitation is in the water. Yet these are ever changing their rank, rising or falling as their understanding grows more or less. And so was the universe completed and all that is therein, one and only-begotten, the most fair and perfect image of its eternal maker.

19. ὁδικος διηλθον] Compare ἔλεος

781 ο καὶ ἄλλος γένος ἦμῶν τῶν ἀνθρώπων λαθρούτερον μᾶλλον καὶ ἐπικλούτερον, τὸ θῆλυ, διὰ τὸ ἄσθενες. Assuredly women treated on the Athenian system would have been either more or less than human, had they not developed some tendency in this direction. Plato however is apparently the only Greek thinker who saw the cause of the evil and proposed a remedy.

21. [Σον] This curious quasi-personification of sexual impulse as an animate being is manifestly to be understood as mythical.
This text is a page from a Latin translation of Plato's works. It contains a passage from Plato's dialogue, including names like Aristotle and references to other works. The text is written in Latin, which is different from the modern English language. It refers to philosophical concepts and discussions. The text is part of a larger work, possibly a commentary or an introduction to Plato's philosophy.
and another in women, which two they formed in the following way. To the channel of the drink, where it receives the fluid passing down through the lungs beneath the kidneys into the bladder and sends it forth by pressure of the air, they opened a passage into the column of marrow which runs from the head down the neck and along the spine, and which we have already termed the seed. This, being quick with soul and finding an outlet, gave to the part where it found the outlet a lively desire of egress and produced a longing to generate. Wherefore the nature of the generative part in man is disobedient and headstrong, like a creature that will not listen to reason, and endeavours to have all its will because of its frantic passions; and again for the same reason what is called the matrix and womb in women, which is in them a living nature appetent of childbearing, when it is a long time fruitless beyond the due season, is distressed and sorely disturbed, and straying about in the body and cutting off the passages of the breath it impedes respiration and brings the sufferer into the extremest anguish and provokes all manner of diseases besides; until the passion and love of both unite them, and, as it were plucking fruit from a tree, sow in the womb, as if in a field, living things invisible for smallness and unformed, and again separating them nourish them within till they grow large, and finally bringing them to light complete the birth of a living creature. Such is the nature of women and all that is female. The tribe of birds was transformed, by growing feathers instead of hair, from men that were harmless but light-minded; who were students of the heavenly bodies, but fancied in their simpleness that the demonstrations were most sure concerning them which they obtained through

The reading of Α, ενδιαγαγότες, is senseless, and equally so is εγαγότες. As to σωμαγαγότες, which would otherwise suit well enough, the aorist can hardly be tolerated, nor has this reading very good authority. The word in Α is an easy corruption of ευναγαάντες, and the other readings look like attempts at correcting it.

22. τὸ δὲ τῶν ὅρνηων] In birds are incarnate the souls of harmless silly people, astronomers who fancy that astronomy means nothing more than what they see with their eyes. The class of persons indicated is clearly enough shown by Republic 529 A foll. I can see no reason for supposing with Martin that the Ionian philosophers are meant. With the epithet κοιφόν compare Sophocles Antigone 343 κοιφόνων τε φίλον ὅρνηων.

25. δὲ δεῖσεις] Cf. Republic 529 A κω-
It is remarkable that the compiler of the *Timaeus Locus* treats transmigration and retribution as a mere fable, though a fable which is useful as a deferent from vice: cf. 104 D ei de kai tis sklaros kai apeithi, tiv 8' epeswv kolasis a t' ek tov nwmwv kai a ek tov logwv, swnwvona epagwv deimata te upouranwv kai ta kal' "Aidev, 8thi koladiksi aparaithtai apostkei diounadimosi veteiroi, kai talalasa de epainow tov 'Iwvwnan ipowv ek palaios poiwnta tois enagvias' ws gar ta sowmata nosowdei poka ygaiwvwe, aiai kai meleki tois ygineostatov, ouvto ta ypsihas apelrwyvmeis yuvdhes logwv, ei kai melektai allathesi. Leugwnto 8' 8thi anagkalois timorwv exwv, ws meteudrhoynen tivn ypsiavn tov men deilwv eis ynovaka akaiwv tov 8' yevwn ekddhmev, tivn de marnwv en terwv sowmata poti kolassin, lagnv, de ei suviv h kawrow.

5. [Ek tovwn onwv yevwv yprrhmevatoj]

There is an interesting parallel in Aristotle's *De partibus animalium* IV x 686a 25 ό μεν ουν άνθρωπος αντί σκελών καὶ ποδών τῶν προσώπων βραχιων καὶ τὰς καλαμανέας έχει χειρας, ὡρθώ γάρ ἐστι μόνον τῶν ἕξων διά τὸ τὴν φύσιν αυτοῦ καὶ τὴν υόλαν εἶναι θέλειν ἄργων δὲ τοῦ θειώτατος τὸ νοεῖν καὶ φρονεῖν τούτο δὲ οἱ ράδιοι πόλλοι τοῦ διώσθην ἐπικειμένου σώματος τὸ γὰρ βάρος δισικείνητο πολεῖ τὴν δίαιναν καὶ τὴν κοινὴν ἀξιόθηναι. διὰ πλευρος γενομένου τοῦ βάρους καὶ τοῦ σωματεοῦδος ἀνάγκη μέτειν τὰ σώματα εἰς τὴν γήν, ὡστε πρὸς τὴν ἀσφαλείαν αντὶ βραχιων καὶ χειρῶν τῶν προσώπων πόδας ὑπεθηκήν ἡ φύσις τοῖς τετράποσιν. τοὺς μὲν γὰρ ὑπόσθεν δύο πάνω ἀναγκαίον τοῖς πορευτικοῖς ἔχειν, τὰ δὲ τοιαῦτα τετράπόδα ἐγένετο οὐ δυναμενὴς φέρειν τὸ βάρος τῆς ψυχῆς.
the sight. And the race of brutes that walk on dry land comes from those who sought not the aid of philosophy at all nor inquired into the nature of the universe, because they used no longer the revolutions in the head, but followed as their guides the parts of the soul that are in the breast. From these practices their front limbs and their heads were by their natural affinity drawn towards the ground and there supported; and their heads were lengthened out and took all sorts of forms, just as the orbits in each were crushed out of shape through disuse. For the same reason such races were made four-footed and many-footed; for God gave many props to the more senseless creatures, that they might the more be drawn earthward. As to the most senseless of all, whose whole bodies were altogether stretched at length on the earth, seeing they had no longer any need of feet, God made them footless to crawl upon the ground. And the fourth class that lives in the water was formed of the most utterly foolish and senseless of all, whom they that transfigured them thought not worthy even of pure respiration, because their soul was polluted with all manner of iniquity; but in place of inhaling the fine pure element of air they were thrust into the turbid and lowly respiration of water. Hence is the tribe of fishes and of all shell-fish that live in the water; which have the

6. προμήκες τε καὶ παντολας] Their heads were elongated, because the circles of the brain were distorted into an elliptical form: the proper and typical shape of the head is spherical, emulating the figure of the universe; see 44 D, 73 C, E; and for the effect of the κύμα τῆς τροφῆς upon the shape of the head see note on 76 A.

12. πάν τὸ σῶμα κατατευνομένοις] Plato's theory pays small regard to the 'wisdom of the serpent': however, as the serpent has an exceptional gift of holding its head upright, perhaps we may allow it to be promoted a few grades on that account.

15. οὺς οὖς ἀναπνοῆς καθαρᾶς ἐτη λεισμοῖη] It seems a little hard upon an animal so highly organised as the fish to be placed nearly at the bottom of the scale merely because it respires under water; and water-snails are probably as intelligent as land-snails. It is possible, as Martin suggests, that Plato may have taken the hint from Diogenes of Apollonia: see Theophrastos de sensu § 44 φρονεύν δῆς, ὑπερ ἐλέχθη, τῇ ἀέρῳ καθαρῷ καὶ ἐγρώμεν κολύέων γὰρ τὴν ἱκμάδα τῶν νοῦν, διό καὶ ἐν τοῖς ὑποίς καὶ ἐν ταῖς μέθαις καὶ ἐν ταῖς πλημμυραῖς ἢττον φρονεύν. ὡς δὲ ἡ ὑγιότης ἀφαιρεῖται τῶν νοῶν σημείων, ὡς τὰ ἄλλα ζώα χειρὸς τὴν διάνοιαν ἀναπνέειν τὸ γὰρ τῶν ἀπὸ τῆς γῆς αέρα καὶ τροφήν ὑγροτέραν προσφέρεσθαι. τοὺς δὲ δριλαῖς ἀναπνεύν μὲν καθαρῶν, φῶς δὲ ὄμολαν ἔχειν τοὺς ἐξθονίς καὶ γὰρ τὴν ἀρέσκῃ στηφάνῳ καὶ τὸ πνεύμα οὐ διέλειν διὰ παντός ἄλλα ἐστάναι περὶ τὴν κολύαν. Compare Herakleitos fr. 74. Ibywater αὐθ ψυχῇ σοφωτάτη καὶ ἄρση: and fr. 73.
1. ἐσχάτας οἰκήσεως] This means not the habitation of the ζώα in the water, but the habitation of the soul in the bodies of fishes, molluscs and the like. It is plain from this passage also that Plato did not contemplate the entrance of a soul which had once been human into any vegetable form: not that there is any physical reason against this, but for the cause pointed out on 77 A.

2. διαμείβεται τὰ ζώα] This passage is important, as clearly indicating that Plato does not admit any state of hopeless degradation. The animals are perpetually changing places as they advance or recede in intelligence: what is a bird in one incarnation may become a fish in another, and vice versa. Even the oyster may, in course of ages of evolution, become once more a human being. Hence it is evident that the everlasting vengeance wreaked upon desperate criminals in the Republic, Phaedo and Gorgias is merely part of the pictorial representation. How far the present scheme of transmigration is intended to be accepted literally is a matter exceedingly difficult of determination. It has no essential connexion with the Platonic ontology; nor again is it obviously inconsistent therewith. The continuance of individual personalities which it presumes is not material to Plato’s theory, which requires that all soul shall be eternal and shall exist in a multitude of separate conscious beings, as well as in its universal unity; but it does not require that the same consciousness shall exist as such in successive embodiments. The question belongs to that mythical borderland of the Platonic philosophy where it is not always possible to draw the line with certainty between the literal and the allegorical.

6. ἐκὼν τοῦ ποιητοῦ] About the genuineness of this reading, which has the support, besides A, of Vat. 173, I can feel no doubt whatsoever. Had Plato written νοητοῦ, it is in the last degree improbable that a phrase so familiar and constantly recurring should have been altered into the far more difficult ποιητοῦ. On the other hand, assuming Plato to have written ποιητοῦ, the word was, I may venture to say, positively certain to be altered in some way: for, the scribe or annotator would argue, the κόσμος is not the image of its maker, but of the νοητοῦ ζώον from which the maker copied it: therefore νοητοῦ is the word. Add to this the probability that some readers would suppose it to be the genitive of ποιητός (a supposition which Lindau actually entertains), and we have so potent causes of corruption that it is surprising that a single manuscript has preserved the true reading. The word ποιητοῦ must necessarily be unintelligible to any student of the dialogue who had not arrived at some such conclusion about the nature of the δημιουργός as that which I have done my best to defend.

Adopting then ποιητοῦ, we have of course but one possible inference to draw:
uttermost dwelling-place in penalty for the uttermost folly. In such manner then and now all creatures change places one with another, rising or falling with the loss or gain of understanding or of folly.

And now let us declare that our discourse concerning this All has reached its end. Having received all mortal and immortal creatures and being therewithal replenished, this universe hath thus come into being, living and visible, containing all things that are visible, the image of its maker, a god perceptible, most mighty and good, most fair and perfect, even this one and only-begotten world that is.

the ἐνυμουργὸς and the αὐτό ἰδὼν are one and the same; the ἐνυμουργὸς being simply a mythical duplicate of the αὐτό ἰδὼν, the introduction of which was necessitated by the poetical and narrative form of the exposition. Both the ἐνυμουργὸς and the αὐτό ἰδὼν represent the primal unity, considered as though not yet pluralised, which must evolve and manifest itself under the form of plurality and so be a truly existent One. And surely nothing can be more thoroughly characteristic of Plato, than that, after talking parables throughout, he should at the very end of the dialogue drop one single word, φωναῖν συνετοίς, which was to open our eyes to the fact that he did speak in parables; that if we desire to understand the philosopher, we must be in sympathy with the poet.

8. ἐσ τὸν ὀφθαλμὸς δέ μονογενῆς ὄν] It is worth while to note how closely the phraseology of the concluding five lines corresponds with that of 30 c—31 b: compare especially the words in 31 b ἔσ τὸν ὀφθαλμὸς μονογενῆς ἑντεῖχε τε καὶ ἐν ἔσται. Plato doubtless designs by thus echoing his former language to assure us that the promise made in the beginning has been fulfilled, that the nature of the universe has been expounded precisely to the effect indicated in the sixth chapter, and that not a single point has been omitted. This very minute correspondence serves to render the one important deviation, εἰκῶν τοῦ ποιητοῦ, all the more strikingly significant. Mark too the emphatic stress which falls upon the two closing words of the dialogue, μονογενῆς ὄν. In them is virtually summed up Plato’s whole system of idealistic monism: this one universe γιγνεται τε καὶ ἔσται, it is create and uncreate, temporal and eternal, the sum total and unity of all modes of existence; in the words of the Platonic Parmenides πάντα πάντως ἔστι τε καὶ ὁκ ἔστι.
